DEEPAK RAM

INTELLIGENCE DEMYSTIFIED

Deepak Ram got interested in spirituality from the year 2002 after some sudden change in his life condition, after which he started reflecting on various aspects of spirituality like desire, fear, selfishness, acceptance, greed etc. This resulted in, his getting transformed from a pleasure seeker to peace seeker. During the end of year 2014, he came across and read some philosophical books and actively started meditation and contemplation. This resulted in, his getting transformed from a peace seeker to a researcher in philosophy. While contemplating he found that some principle aspects (of spirituality) are more important than others as the other aspects are derived from these main important principle aspects. This led him to write the book titled Guide to Awakening (Published in May 2017), which is about principle aspects of spirituality. While writing the book he realized that contemplation on these principle aspects vastly improved my intelligence besides the obvious benefit of peacefulness. This led him to write the book titled Intelligence Demystified (Published in September 2017), which is about human intelligence. While writing this book he realized that there is a purpose in all aspects of life and everything is interrelated. This led him to write this book titled Dynamics of Human Life (Published in April 2018), which is about relationship between various aspects of life, their purposes and purpose for human life.

Prior to writing books, he worked in the chemical and software industries. Later due to family needs he took a break from employment and started researching on philosophy and writing books. Visit his website www.ramdeepak.com to know more about him.

Developing intelligence is the most important aspect of mankind. Lack of intelligence is caused by absence of knowledge of some aspects of life and presence of incorrect priority of some aspects of life. While perceiving various aspects of events, beings or things our mind exaggerates them due to the forces of attraction (which are mostly manifested as desires) and repulsion (which are mostly manifested as fears).

Due to these forces, we perceive some aspects of events, beings and things with incorrect priorities, leading to disturbance in the mind and incorrect decisions. The disturbance in the mind and incorrect priorities are the cause of lack of intelligence of following two types in the mind.

1) Lower level Intelligence, which is nothing but capacity to understand and do complex logical tasks like solving a math puzzle or finding a scientific solution to a problem.

2) Higher Level Intelligence, which is nothing but capacity to do complex logical task involving people, events and things like handling a chaotic situation or managing an organization.

This book provides information about high-level nature of our mind with valuable insights to improve low-level intelligence and methodology to improve high-level Intelligence.

Chapter 8. Setting Right Priorities 64

Chapter 9. Reflections on outside and inside worlds 70

Appendix 1. Metaphysics 75

Preface

Author of this book is following spirituality from the year 2002 after some sudden change in his life condition. Before this time his only objective was to seek pleasure. He was introduced to Vedanta philosophy during the end of 2014, after which he started meditation and contemplation. While contemplating he found that some principle aspects are more important than others as the other aspects are derived from these main important principle aspects. He also realized that contemplation on these principle aspects vastly improved his intelligence besides the obvious benefit of peacefulness. He has tried to present the essentials of what he has learnt and is practicing, in this book. He has also included some of his own conclusions, which he arrived at while contemplating, regarding the nature of various

aspects of life. So, there may be difference of opinion with some of the readers regarding some of his findings.

The main point of the book is that we are not accurate in perceiving the various aspects of life, which cause disturbance in the mind and incorrect priorities. This happens due to two types of forces acting on our minds; Attraction or Desire and Repulsion or Fear. The incorrect priorities and disturbances are the cause of lack of intelligence of two types (High Level Intelligence and Lower Level Intelligence, which are explained in first chapter). Every moment of our lives we make decisions based on our level of High-Level Intelligence. Even to not do anything is a decision. So, our success in life depends largely on our level of High-Level Intelligence.

In this book author explains the nature of human mind, with valuable insights to improve low-level intelligence and then explains the nature of world and human life. He goes on to describe the vision, mission and methodology for improving high-level intelligence to make an individual, successful, peaceful and stress-free.

Chapter 1. Nature of Human mind.

At a high level, the primary constituents of mind are, sense and memory perception instruments, memories, intellect and firmware. All the constituents are similar in all humans, only configurations are different. The interaction of firmware with memories and intellect result in intelligence. Decisions based on intelligence result in actions. One more aspect which is present, is consciousness. In this chapter, the high-level nature of human memory, intelligence and consciousness are discussed along with aspects of quality of life and its diversity, which makes it interesting.

Human Memory:

Everything in the mind are just impressions, which we call memory.

Intelligence is nothing but reading the memory and extrapolating it to make decisions. All actions are

nothing but making decisions to use the controls of the body based on the intelligence. Some of our configurations, which are also pre-built memory or impressions determine how we perceive certain events. These are based on the level of attraction or repulsion with which one perceives things. Mind is an instrument which reads memory continuously and creates fresh memory out of it. If we perceive events with higher priorities, memory of that event becomes strong. Stronger memories lead to disturbances in the mind and thus it affects mindfulness. The incorrect priorities also lead to incorrect decisions and thus it affects intelligence also. The bottom line is that our consciousness (or mindfulness) and intelligence depend on the type of memories we carry. Our intelligence selects particular records from the memory and senses in time sharing bases, according to the priorities, extrapolates them (based on related memories), feeds the thinking process,

creates fresh memories, initiates actions and brings them to consciousness in parallel processes. So, what differentiates between people is that the type of perceptions they have are different, which results in different types of memories (Strong or weak), which results in different way of thinking and decision making for the same situation. Thus, it can be reckoned that, intelligence is different among different people, although algorithm of intelligence is same, as the memories on which the intelligence work is different, due to difference in ways of perception and level of mindfulness of an individual.

Consciousness:

Consciousness is nothing but being aware of the environment including our thinking. There are various processes reading the current status of various systems and what we call consciousness is the main system, which reads the status from all systems in time sharing fashion according to the

relative priorities of the systems and processes and makes us aware of them at real time. In other words where our consciousness points to at this moment depends on our senses (which depends on the environment) and our intelligence (which selects particular records from the memory and senses in time sharing bases, according to the priorities, extrapolates them, feeds the thinking process, creates fresh memories, initiates action and brings them to consciousness in parallel processes). What we call concentration is nothing but giving relatively high priority to a particular process and low priority to others. We need to do meditation and contemplation to reduce the priorities of various systems and their processes to bring them under control and concentrate on those aspects which are under current study by developing interest on those aspects. Here again providing too much interest or priority to even these aspects will make the mind

disturbed. We need to just provide little more priority than others. Concentrated processes lead to stronger memories and are more efficient compared to ones disturbed by other processes due to higher relative priority in case of the former one.

Human Intelligence Demystified:

Developing intelligence is the most important aspect of mankind. At a high-level Intelligence (Human Intelligence) is capacity to find solution to a logically challenging problem, often involving people with conflicting interests and complex aspects of life. At lower level it is deciding what is next bit of information to be processed and what way it is processed. It depends on perception of events or entities from memory or external source. It is driven by priorities of events and entities in the mind. When the priorities are very high there is more thinking and feeling activity leading to disturbance and incorrect decisions and actions. When you are doing an activity

if some other event or entity has been given a high priority it interferes with the activity and processing of that activity is inappropriate. It is like for example, if you are studying and mind is disturbed, you are not actually studying because the process of studying is incomplete due to interference by a different process. Our intelligence selects particular records from the memory and senses in time sharing bases, according to the priorities, extrapolates them (based on related memories), feeds the thinking process, creates fresh memories, initiates actions and brings them to consciousness in parallel processes. So, what differentiates between people is that the type of perceptions they have are different, which results in different types of memories (Strong or weak), which results in different way of thinking and decision making for the same situation. Thus, it can be reckoned that, intelligence is different among different people, although algorithm of intelligence is

same, as the memories (including configurations) on which the intelligence work is different, due to difference in ways of perception and level of mindfulness of an individual. The way our intelligence is implemented is that for high priority situation, since faster response time is needed, the intellect decides immediately, without referring to the memories already stored. For low priority situation the intellect refers to the memories already stored (our memory bank). Accuracy of an operation depends on the scale at which input and output parameters are measured. Similarly, human intelligence is fine grade or coarse grade. Fine grade is when priorities of various aspects are relatively low in magnitude. So, in this case the events are perceived with relatively lower priorities and hence our intellect considers and checks with our memory bank for relative memories and compares various options and gives accurate results. Coarse grade is

when priorities of various aspects is very high. In this case the events (from memory or senses) are perceived with higher priorities and our intellect decides on that immediately, without referring to the memory bank, hence the decision will not be accurate. So, all the other relative perspectives related to the event are not reckoned. In short, we may say fine grade intelligence is more accurate and orderly whereas coarse grade intelligence is more interesting and disorderly for obvious reasons.

Lack of intelligence is caused by lack consideration of some facts of life and having incorrect priority of some aspects of life. To develop intelligence, we need to create memories of important facts about plants, animals, ourselves and the universe by study and research. We also need to have a high-level overview of principle aspects which help us to prioritize the other aspects of the universe. This we do by meditation and contemplation on the principle

aspects to know closest estimation of the nature of those aspects and their relative importance. The by-product of being intelligent is getting better experience in this world. The by-product of acting intelligently is increased efficiency, flexibility and freedom.

Every moment of our lives we make decisions regarding the events presented to us from our memory or some external event. Even to not do anything is a decision. These are based on the priorities we mentally assign to the various aspects. These happen so quickly that most of the time we feel we are impulsively reacting to the situation. But everything is happening based on some major principles. If we understand the principles, which created the problems in our mind, we can find a way to correct those conditions. So, to say our entire life depends on these principles is not an exaggeration. Many people have right configuration of intelligence

by birth and are successful without being aware of the knowledge of principles that affect intelligence, but for majority of people knowledge and application of these principles is necessary.

Our intelligence is affected due to two types of forces acting on our mind viz. attraction and repulsion. These forces create disturbances and incorrect priorities while perceiving various aspects life. The disturbances affect one type of intelligence, which we may call Low Level intelligence, which is capacity to do a complex logical analysis. The incorrect priorities affect another type of intelligence, which we may call High Level Intelligence, which is capacity to do logical decision involving complex aspects of life and often with conflicting interests.

The forces of Attraction and Repulsion are manifested as follows.

1) Attraction: Manifested mostly as Desire for Creativity, Desire for Possession, Desire for Pleasure and Desire for Appreciation.

2) Repulsion: Manifested mostly as Fear of Poverty, Fear of Discomfort or Pain, Fear of betterment of others, and Fear of Depreciation.

Improving Higher Level Intelligence:

Due to the two types of forces, there are two types of relations with the events, beings or things, with often both components being present and with dynamic changes in composition.

1) In-Conflict-Of-Interest: We dislike the event, being or thing perceived as In-Conflict-Of-Interest with us. For example, mother-in-law or a colleague trying to dominate.

2) In-Common-Interest: We are attracted to the event, being or thing perceived as In-Common-

Interest. Example may be son doing well in exams or a caring mother.

Most of the bad experiences people have is due to conflicts of Interest with others and not because people are bad. We need to build high level intelligence to skillfully manage both type of relations and the forces acting on us by training the mind by means of meditation and contemplation on the spiritual principles. Refer Appendix 5 for Five Main Principles of Spirituality.

Improving Lower Level Intelligence:

An optimum interest in the subject matter and a calm mind are needed to develop lower level intelligence. So, the factors helping High Level Intelligence also help in improving lower level intelligence.
However, lower level intelligence also increases with practice in area of interest.

Quality and Longevity of Human Life:

Our body and mind have been developed according to the requirements of our creators, keeping in view the key aspects of making life diverse and interesting. However, we may want to tweak them to suit our individual needs. There is nothing much we can do personally to improve our body to a large extent. Better eating habits and exercises help to improve the body, by a maximum of 20%. But there is tremendous potential to improve our mind. The means of improvement of mind are contemplation and meditation.

Key aspects we look for in life is quality and longevity of life. Longevity has many factors and personal effort (right eating habits and exercise) may yield a maximum of up-to 20% improvement. Quality of life depends on quality and quantity of resources we have and quality and quantity (optimum, not excessive) of our thinking.

Thus, there are three important aspects in the order of importance, that we should provide, with our efforts to improve these aspects.

1. Quality and Quantity (optimum) of thinking.
2. Quality and Quantity of resources.
3. Quality (health) and Quantity (longevity) of life.

The order of importance is justified based on points below.

1. No. 1 helps in achieving nos. 2 and 3.
2. No. 3 depends on many factors and our personal influence will result in only say up-to 20% improvement. (whereas there is vast scope of improvement in no. 1)
3. If no. 1 is taken care of, minimum necessary requirement of no. 2 is guaranteed.

Thus, quality of thinking is the most important aspect in human life.

Quality of thinking is improved by mindfulness and intelligence. Mindfulness is affected by disturbance in

the mind due to occupation of some other matter of higher priority. Incorrect priorities and disturbances affect the intelligence also. Priorities of events in the mind increases with repetition of that event and due to attraction and repulsion to various aspects as per our desires and fears. So, to improve mindfulness and intelligence we need to reduce desire and fear and practice to perceive things without providing undue importance. While needing better memories like for studies, we can increase the priority of the subject by repeating the process.

Another way of improving mindfulness is by giving higher priority to quietness and repeating activity of quietness. Mindfulness helps in analysis of our thoughts. We should keep a watch over our thinking as it is a separate entity and not feel as if our self is thinking.

In the nutshell, mindfulness and Intelligence are affected when things are perceived with very high priorities due to desire and fear.

Besides mindfulness and intelligence, we need to understand that making it interesting is an important aspect of the life in earth. Following is the justification.

1. If our creators wanted, they could have made everyone beautiful and very intelligent. For example, one time if you read you never forget or you never make a wrong choice.
2. Without both negative and positive characters of varieties, you cannot have many interesting life stories.

We should take a cue from this and try to be light hearted. Thus, having fun in little things, which makes our life interesting is very important besides making progress in improving infrastructure and resources. However, we need to recognize that it is the

intelligence which makes us realize about importance of other aspects. So, our intelligence is supreme in importance.

Points for summary:

1. What makes people differ with respect to intelligence is the memories they have and create.

2. Type of memories depend on priorities with which we perceive things.

3. Only configurations of perception instruments in the mind are different and other things are similar.

4. Memories with incorrect priorities lead to incorrect intelligence and also disturbed mind.

5. To improve perceptions we need to first have a control over our mind, and then feed the mind with correct relative priorities of important aspects, by

trying to realize the closest estimate of the nature of these aspects.

6. Meditation and contemplation on spiritual principles help in having a control over the mind by changing the configurations of the perception instruments in the mind.

7. Spiritual principles help to realize the closest estimate of relative priorities of various aspects of life.

8. When you try to solve a complex problem, we should be conscious of the thinking process and try to come up with a better solution even if the previous one was obviously correct. If we get a better solution, we update previous memories with better ones. If we do not get a better solution, we need to contemplate that we will go with the previously thought one, but there may be a better solution.

9. We should have stronger memories, that lasts long, of the guiding principles and weaker memories of situational memories, which can be created if need be. This can be done by repeated thinking or studying the principle aspects. Good stock of building blocks helps to create the design as and when needed.

10. Stronger memories lead to faster response but do not consider alternative perspectives. Such memories often create stronger reactions than needed and thus lead to disorder.

11. Weaker memories lead to considerations of all related perspectives and thus are accurate. However, response time of decisions are slower compared to when memories are stronger.

12. Parallel processes lead to loss of awareness and accuracy.

13. Concentrated processes lead to sustained awareness and improved efficiency.

Chapter 2 – Nature of this world and human life.

At a very basic level, we want to have good thoughts and feelings at most of time and at least of time, discomforts or depressive thoughts and feelings. Based on the above objectives, we need to put our efforts. For this, we need to know the priorities of important aspects of life. For example, most of us spend most of our efforts in acquiring resources. This document will help us realize the importance of various aspects of life. To know more about these aspects, the important things that we need to learn and understand are, the nature of world in earth, the nature of our life in general along with nature of problems faced by man.

The nature of the world in earth:

If we look at some aspects of this world, like electricity, magnetism, gravity etc, it may be concluded that there is a common source of energy, which is making these things happen. The same is true about all life and matter. That energy or common source has to be everywhere. Scientists have found out that what we see as matter are actually a combination of particles and waves. We call the particles as atoms, electrons, protons etc. These particles are the design elements and therefore cannot be the original source of energy. The atoms, electrons, protons etc. cannot move on its own. It is the underlying source of energy, which is causing all the movements. The original or common source of energy is that which presents itself as particles, waves and space between particles. There are some programmed patterns, developed by some intelligence, according to which, the source behaves.

Therefore, we are all just wave patterns, which took shape based on some programmed patterns, but have wrongly identified as ourselves. Only if God (source of all energy) himself became eyes, ears, mouth etc., while developing them, thou could have tested their workings. This is the proof that the original source of energy can take any form. It has just decided to take the present form. One more aspect is that god or original source of energy must have experienced all types and degrees of pain and feelings. While we connect with the pain and feelings of only our body, thou can connect and disconnect with anything. Due to the feeling of discomforts, we are bound to this pattern (body), escaping only after a complete pattern change (when we pass away). Although most of the things happen due to higher powers, due to false identification with the pattern as ourselves, we assume the sense of pleasure, pain and accomplishments as our own. Moreover, how can we

say I am this body, when I do not know exactly how I am made. We know very little about the technology with which matter is made. We even don’ t know what is the exact nature of the physical pain, that we experience. Whether we perceive this world as gross or subtle makes a difference in our perceptions. Gross aspects are perceived with higher priorities compared to subtle aspects. We will see later how priorities during perception affect our intelligence.

Therefore, best way to deal with this situation is, to consider ourselves as actors with roles in the drama of life, without taking anything personally.

High level Inquiry:

The following inquiry helps to understand life from high-level perspectives.

1) Do you consider our creators to be more mature, more experienced, more knowledgeable, and more intelligent than humankind?

2) If the answer to the above question is in the affirmative, then is it not that there is and will always be order in the workings of the creators?

3) If the answer to the above is in the affirmative, is it in order that everybody gets all the good qualities and unlimited resources?

4) If the answer to the above is in the negative, is it not that diversity and interesting stories are the fundamental basis of this world?

5) If the answer to the above question is in the affirmative, should we not try to understand our role in the workings of our creators, rather than chasing our desires?

6) If the answer to the above question is in the affirmative, then should we not have acceptance to all that is happening and try to understand the world and ourselves in a better way?

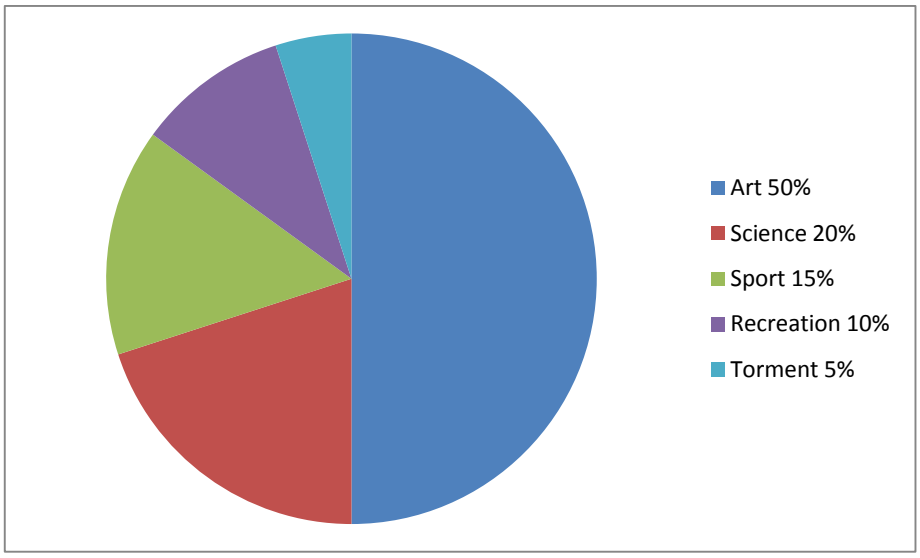

High level nature of human life:

If we closely analyze life, we will realize that, every moment comprises numerous opposing forces, with resultant force tending towards zero. It is only due to our mind's consideration of the individual effects, without reckoning the balancing effects, that we have feeling of likes and dislikes. We need to understand the nature of life to make it work for maximum benefits. This is the primary art of life. Due to diversity of experiences, we all may perceive life differently. However, it is more of an art than anything else. The attributes of an art are story content, diversity and interesting-ness, where as those of science are research, efficiency and intelligence.

This creation is not optimized for Intelligence and efficiency, but is optimized for having stories, diversity and interesting-ness. Therefore, life is an art of God to enable art, science, sport, recreation and torment for us. The break-up of various components to is as follows.

1. Art (50% - Interesting, Stories, Diversity):
Art of politics used in all our affairs. Diversity and interesting stories are basis of everything.
2. Science (20% - Research, Intelligence, Efficiency):
Art is used by people to induce barrier to entry. Science will saturate in few decades. We need to find the art of keeping it interesting.
3. Sport (15 % - Competition, Rules):
Science and art is used in sport to induce interest.
4. Recreation (10% - Sensitivity, Pleasure):
We can indulge in this for limited period in a day. Moreover, most enjoyable aspects have side effects.
5. Torment (5% - Disease, Exhausting):

This is not the point of focus with most of the people. However, combined effort in minimizing the pain in humanity is a worthwhile cause for our own good.

High-level nature of human life i

As shown in the above figure, life is more of an art than it is anything else. Therefore, we should not just try to maximise our efforts and just try to get

maximum out of it. We should make time for fun and enjoy the creative aspect of it.

Consequences of treating life as an art (a role in a drama of life) are as follows.

1. Even negative roles have some purposes.
2. Participation is more important than achievements.
3. Different people like different roles. This helps in maintaining diversity.
4. Stress is less as you consider life as just a role in the drama of life.
5. You strive to improve your performance and thereby try to get better roles.
6. In a drama team performance is more important than individual brilliance.
7. The rich considers it as just a role and not gets attitudinal problems.
8. The poor considers it just a role and will not get overly dejected.
9. We make interesting stories wherever possible.

10. We will consider death as just end of a role and will not take it as something drastic.
11. Everything is as per role, so no tension.
12. Since diversity is promoted, efficiency maybe only one of the considerations. Creative and fun aspects get highlighted.
13. We will worry about the result only after the end of the role and not during our performances, but enjoy all types of performances.

Relative priorities of important aspects of human life:

There are various aspects in our life with varying degree of importance. It helps in our decision making if we know the relative priorities of important aspects. In my view the following are the important aspects in the descending order of importance. The other aspects derive from these.

1. Intelligence, which includes quality of thinking and feeling, self-worth, self-respect
(Depends on Philosophy, Mental configuration)
2. Luck or higher power's interest in you. (Depends on Circumstances and intelligence)
3. Resources (Depends on Circumstances, occupation and above two)
4. Health (Depends on Circumstances)
5. Daily routine (depends on Circumstances and philosophy)
(Includes Work, reading, maintenance)
6. Free time (Depends on Philosophy, Mental configuration)
(Includes hobbies, meditation, contemplation)
7. Family (Depends on Circumstances)
8. Education (Depends on Intelligence/interest, resources)
9. Occupation (Depends on Education, Circumstances and need)

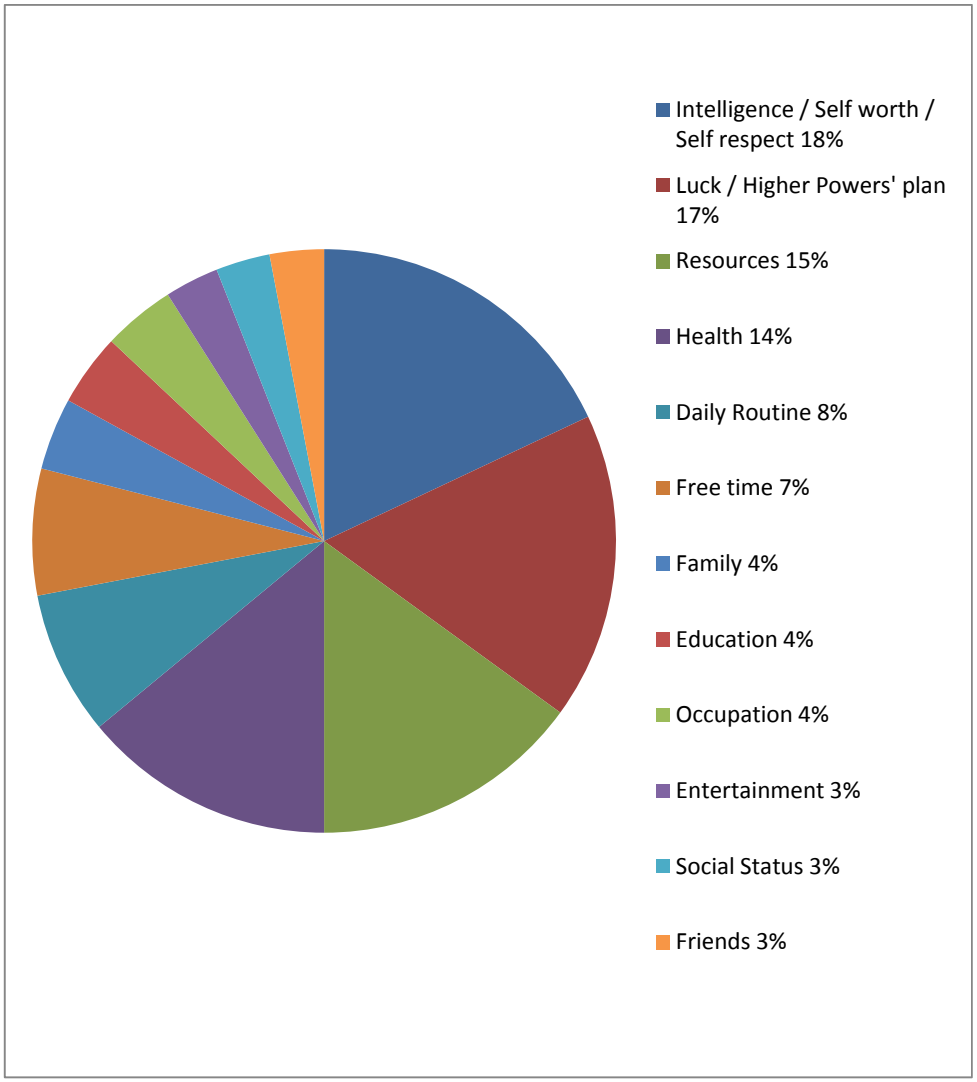

(If resources are inadequate, occupation takes its position.)

10. Entertainment (Depends on Resources, free time and interest)

11. Social Status / Social causes (Depends on Occupation and interest)

12. Friends (Depends on Circumstances and interest)

(If intelligence is inadequate, Friendship becomes important as family.)

Relative priorities of important aspects ii

As shown in the above figure, there are so many aspects in life. However, we neglect some important aspects and run after only selected few. For example, many go for acquiring resources and entertainment. If we do not sharpen our blade and just look at

productivity, we will not achieve the best. Our mind is the greatest tool we have and we need to put efforts to improve them. Contemplation and meditations are the means to improve one's mind.

Nature of problems faced by man

The problem of physical pain is the only real problem faced by a person. The problem of physical pain is disguised as three types of problems. These are lack of following three important aspects of life.

1. Mental health: A person with good mental health is in joyous state at all times. Although most people do not have control over the mind, we are mostly responsible for maintaining good mental health. Good intelligence (emotional) helps in keeping good mental health. For most people mental health depends on external situations, which they try to control. A Few have practiced spiritual ways to

decouple mental health from external situations. Mental problems are disguised as various emotions, which lead to depression in extreme cases. Most mental problems, unless it has progressed into a disease, can be solved by philosophical methods. Mental health can be 100 % in our control, until we become very old. Even the suffering of physical pain can be reduced to a considerable extent if mental health is made sound by using philosophical methods.

2. Physical health: This is in our control to the extent of maximum of 15% only, because it depends on various factors, which are beyond our control. Nevertheless, if we are totally careless and do not take basic precautions, then it may become a worrying problem. Physical problems are disguised as diseases. Lack of physical health can lead to poverty (resources problem) and mental problems.

Mental problems can be avoided if the mind is made very sound by philosophical methods.

3. Resources (wealth): Depends on our mental and physical health and luck. Therefore, this also depends on various factors and this is in our control to the extent of maximum 15% only. Resource problems are disguised as poverty. Poverty can lead to physical health problems and mental problems. Mental problems can be avoided if the mind is not made very sound by philosophical methods.

While in the descending order of the extent of our control over the problems, it is mental health > physical health > resources, most people have more focus in the reverse order. In other words, we are more responsible for having a good mental health and higher powers are more responsible in maintaining our physical health and resources.

Nevertheless, we need to try our best to impress our higher powers by doing required activities, while not defocusing from our mental health.

Points for Summary:

1. We are not the body, mind and soul. How can we assume full ownership of these things, when we have such a limited say in our creation, maintenance and destruction? We do not even know what exactly we are made up of.

2. We are just identities with roles in the drama of life. The higher powers decide most of the scripts in the play. We manage our faculties with the best of our abilities to play our part.

3. Life of man in earth is more of an art than it is anything else. Art represents expressiveness, diversity, interesting-ness etc.

4. While attraction and repulsion during perception has purposes, they affect intelligence. We need to put efforts to reduce the attraction and repulsion from our perception. Intelligence is an instrument, which help us in getting better roles in lives and reducing discomfort.

5. We need to work out proper priorities of various aspects of life based on reality and not based on attraction and repulsion. This also helps in improving intelligence, which helps in getting better roles and reducing discomforts.

6. Our roles are constrained by the plans of the higher powers. Not all will get the best roles, but we all can do our best by completing it in a unique way and make the life interesting.

7. Suffering of physical pain is only the real problem being faced by man, it is disguised as problems in physical and mental health and lack of resources.

8. All suffering can be reduced by means of philosophical methods.

9. There is lot of potential in improving the decision making of the mind. Contemplation and meditation are the means to do it.

Chapter 3 – Goal, Vision, Mission and Methodology

In authors view the purpose in life of a human being or any other creature is to examine, explore, experiment and experience themselves and the world. In fact, everyone and every living creature on earth does that. Some even get the opportunity to share the knowledge by exemplifying and expounding. More a being is intelligent, the better will be his or her experience in this world. In author`s view, the following should be the goal, vision, mission and methodology for making ourselves intelligent. We can have other short-term goals but progressing in our mental capabilities and realizing high level intelligence should be the goal of life. After becoming more intelligent one continues to examine, explore, experiment and experience the world in a smarter way.

Goal: To realize the highest-level of Intelligence.

Vision: To feel complete in all situations at all times and to feel successful and satisfied at all times.

Mission: To be always conscious of what we are feeling and thinking and perceiving all important aspects of life with right priority.

Methodology: To become more intelligent we need to remove those aspects from our personality, which cause disturbance in our mind, namely possessiveness, desire and fear. After our mind becomes sufficiently calm, we need to contemplate on those aspects which reduce the priorities of various aspects of life which got exaggerated importance due to possessiveness, desire and fear. Finally, we need to mentally assign fresh priorities for various aspects of life by giving more weightage to principle aspects compared to people, place, situation or thing.

In this book methodology for realizing our goal, vision and mission is organized as follows.

1) Acquiring knowledge of the main principles that affect our thinking, feeling and actions by studying Chapter 3 (The five main principles that affect quality of life).

2) Reduction of possessiveness, desire and fear by studying Chapter 4 (Reduction of possessiveness, desire and fear?).

3) Meditation and Contemplation. This is mentioned in Chapter 5 (Meditation and Contemplation).

4) Daily evaluation of progress as described in Chapter 6 (Evaluation of Progress).

5) Finally, we need to set fresh priorities in our mind for various aspects of life with correct

weightage. This is explained in chapter 7 (Setting Right Priorities).

The other chapters are available to enhance perceptions of readers regarding different aspects of life, to broaden their perspectives.

Chapter 4. Five main principles that affect quality of life.

The quality of human life depends on the way we feel, behave and decide in response to various situations. Following are the five main principles, that determines the quality of life of a human being.

1. Quality of thinking is the main factor that affects the quality of life of mankind in the earth. The quality of thinking determines the quality and quantity of action, which determines the quality of life.
2. Our thinking is affected by attraction and repulsion to some aspects during perceptions. Reducing desire, fear and ego, using spiritual practices helps to overcome the attraction and repulsion during perceptions.
3. Being conscious of higher powers, who plans and guides our show, vastly reduces disorder in

the mind and improves mindfulness and intelligence, which are necessary for better quality of thinking and living.

4. Everyone is equal in priority. Although each one of us have different roles, we are unique in nature and serve the purpose of making life diverse and interesting. So, in one way we are all equal. Realization of this fact also vastly reduces disorder in mind and improves mindfulness and intelligence, which are necessary for better quality of thinking and living.
5. The present moment is all that is there.
   Thinking overly about the past and the future affects the quality of life in the present. The past and future are guided by our higher powers and we have only the window of the present moment to act.

Chapter 5. Reduction of Possessiveness, Desire and Fear.

This chapter explains how we need to contemplate and suggest to our minds that possessiveness, desire and fear affect our perception and thus affect our intelligence. When we do this our possessiveness, desire and fear will melt down.

Contemplation on the following points will help to reduce possessiveness.

- Possessiveness towards ourselves (which is ego) can be reduced and gradually removed by contemplating that god, who has created us and the universe is our real owner. We are how we are because the creators made us like that. So real credit or discredit of our intelligence should go to our creators to a large extent because one may get a confused mind which finds it difficult to improve. A grace of god is needed for such an individual to

come out of his or her ignorance. Our job is to put efforts to improve our intelligence by using established facts and by exploring and experimenting. Our apparent false ownership is the cause of desires and fears, which affect our perceptions and thus peacefulness and intelligence.

- Possessiveness towards parents and children can be reduced and gradually removed by contemplating that we are just their care takers and the real owner is god, who created the sperm and ovary, that created the children. Imagine you are a robot created by god and you are programed to give birth to another robot, with same program but with different configuration (based on some random algorithm), when another robot presses on one of your buttons. Are not all robots, being with the same programming by god, belong to god and are equal? Why there should be so much attachment with specific people, to the extent that success or failure of those specific

people becomes your success or failure? Why not identify with the whole mankind or with god and always feel happy for everybody`s success? Absence of possessiveness will make our mind perceive things better and thus help in achieving our goal, vision and mission.

- Possessiveness towards other groups and objects can be reduced by contemplating that only due to false perception, we feel some groups of people or organization or country or some objects are more important than others. We should meditate that the entire creation is one system and compared to the total creation and its play, the individual thoughts on group of persons or objects is of very little importance. Absence of possessiveness will make our mind perceive things better and thus help in achieving our goal, vision and mission.

Contemplation on the following points will help to reduce desire.

- Desire for happiness can be reduced or gradually removed by contemplating that both happiness and sadness are fleeting and therefore illusion. The desire for happiness creates an illusion that if we get such and such objects, we will be happy. If we do not get those things, we become unhappy and if we get those things, we get temporary happiness along with desire for more things. We can achieve the feeling of bliss, irrespective of our material condition, if we do meditation and contemplation. This will help in perceiving things better and thus help in achieving our goal, vision and mission.

- Desire for an object can be reduced and gradually removed by contemplating what will happen if that object is there with us in plenty and everybody else also has it in plenty. For example,

suppose we have a strong desire for a palace with large garden, swimming pool, etc. We should question ourselves that if we have all these things and also everybody else also have these then in that case, will we be always happy? We will compare with others, for other things and feel either happy or sad depending on the comparison. So, it is the perceived difference in the mind compared to others, which gives us temporary feeling of happiness. The same feeling of happiness and greater bliss can be achieved by contemplating that all of god`s creation is equal and only their role and needs are different. If we reduce our desire, we will be perceiving things better and thus help in achieving our goal, vision and mission.

- Similarly desire for pleasure seeking like eating, drinking, sex etc. can be reduced or gradually removed by contemplating that they give temporary excitement and block us from realization our goal,

vision and mission. These pleasures are addictive and too much of them are harmful for our body, mind and intellect.

Contemplation on the following points will help to reduce fear.

- Fear of death and ill-health can be reduced by accepting that what we fear can happen any time and we cannot do anything about it. But fear of them will affect our intellect and peacefulness and induce stress. Absence of fear will make our mind perceive things better and thus help in achieving our goal, vision and mission.

- Fear of poverty can be reduced by contemplating that there are many who do not have even basic necessities and are still living. Even if we become poor, we will not be the only one. Ask yourself the question; "Why not me? Absence of

fear will make our mind perceive better and thus help in achieving our goal, vision and mission.

- Fear of loss of prestige can be reduced by contemplating that in god`s eyes all are equal. We are just playing different roles as directed by god. Absence of fear will make our mind perceive things better and thus help in achieving our goal, vision and mission.

- We should recognize all the things we fear and eliminate them one by one by either dismissing as illusion, by faith that it will not happen, or acceptance of the possibility, in case by case basis. Only real problem is physical pain which may come in various ways and you never know when it will come and we cannot do much about it other than managing them with medicines. But worrying about it will affect our present perception and thus will take us away from our goal, vision and mission.

Chapter 6. Meditation and Contemplation

When we do meditation and contemplation as described in the following paragraphs (after the note), every day, it will help to reduce the exaggerated priorities given by mind to various aspects, due to possessiveness, desire and fear and over a period of time we can see ourselves as more and more intelligent, peaceful and stress free. In other words, we start getting more freedom, confidence and intelligent.

Note: By contemplation and meditation I mean to think and feel deeply about the object or meaning of the words with full concentration and closed eyes. There is no specified time period for the meditation and contemplation. Even doing them for five minutes, every day, will help. Once we start experiencing joy or lightness, we will want do them at least for 15 minutes, two times a day. The idea of

all the points above is to make the mind quiet and peaceful by reducing the priorities assigned by mind to people, place, situation and things and thereby reducing the load on the mind so that intelligence can be built in by assigning right priorities to various aspects of life at a later stage.

Following are the statements we need to contemplate on or meditate. All these statements serve the purpose of reducing priorities of various aspects of life in the mind to reduce disturbances and correct discrepancies.

- Contemplate that everything that is happening is as per Higher Power`s plan, will, ownership and responsibility and hence right for the moment, although, I may not know the reason.

- Identify with the whole world and contemplate that you are one with everybody and everything. Everything is part of the same system and everybody

and everything is same and equal. Feel that the rich or the poor, the strong or the week, the knowledgeable or the ignorant, all are equal. Also, person belonging to your religion or other religion, your country or other country, all are equal. Same god has created everybody and apparent difference is only due to different roles being played in the drama of life. Stay in this feeling for couple of minutes.

- Contemplate that each individual thought or feeling is of very less priority compared to the vast creation and its play. Every moment, which is apparently either good or bad, is of same priority.
- Meditate with consciousness on the present moment and imagine yesterday was never there and tomorrow will not come. Feel that being joyful in this moment, is everything in life. Stay in this feeling for couple of minutes.

- Be often conscious of thoughts and feelings throughout the day, and not resist any situation. Try to consciously feel your body as frequently as possible. When thoughts come by, be aware of the manifestations of possessiveness, desire and fear and mentally assign a very low priority to the thoughts which are involuntary compared to the thoughts which you consciously initiated.

Chapter 7. Evaluation of progress

The steps mentioned below help us in knowing whether we are progressing in reducing priorities of aspects of life which got exaggerated importance due to possessiveness, desire and fear. Following are the steps to do a qualitative review of success in achieving results of meditation and contemplation done as mentioned in last chapter.

- With full concentration (with full consciousness and eyes closed) ask yourself the question; "What do you badly want to change right now?" If answer is "nothing" then it is excellent progress. The more you want to change the things around, the lesser you have progressed.

- With full concentration (with full consciousness and eyes closed) ask yourself the question; "What do you desire?" If answer is "nothing" then it is

excellent progress. If you have desires it would mean more progress is needed.

- Think about who are the most and least important people in the world. The more you perceive difference between people the less you have progressed.

- While meditating (while thinking deeply with full consciousness and eyes closed) ask yourself the question; "What do you fear?" If answer is "nothing" then it is excellent progress. If you have fears it would mean that more progress is needed.

- With full concentration (thinking deeply with full consciousness and eyes closed) ask yourself the question; "What are the important events in your life?" If all the events are unimportant such that the happening or not happening of the event does not make any difference to you then you have made

excellent progress. The more the events you give importance to, the more progress is needed.

- Most of the time if you are thinking about the present moment then you have made excellent progress. The more you brood over the past and worry about the future, the more progress is required.

Chapter 8. Setting Right Priorities

Mind works by thinking, feeling and deciding (for action or inaction) when it perceives information from either memory or environment. Thinking has been developed as an involuntary process, in which our mind picks up various events from the memory based on the priority assigned by our mind and connection the event has with the previous event, as in a continuous loop. Also, the priority of the event reduces with time if we do not frequently think about the event.

Due to our possessiveness, desire and fear, more priority is assigned by our mind to certain information compared to reality. Incorrect priority or importance assigned by mind to information perceived by it, leads to incorrect thinking, feeling and decision making (for action) which in turn lead to, unintelligent and stressful life. Compared to the

total creation and its play, the individual current thought or event, is of very less importance. But mind acts as amplifiers and exaggerates everything based on the level of possessiveness, desire and fear we have on the subject matter. By meditation and contemplation on the spiritual principles, we correct the priority of all information. Also, we should be conscious (bring attention to the consciousness) of the thinking, feeling and decision-making process and mentally assign a low priority to the current matter compared to the principles and the aggregate. Decision-making can be improved drastically if we instead of reacting to a situation, we accept it fully with right priority and after couple of seconds enquire the mind for the right options for action and decide accordingly, after thinking and feeling about the options. For that we need to give appropriate weightage for all aspects of the situation and then arrive at the decision. To do this correctly

we should create a priority list of various aspects. While creating the priority list we need to assign higher priority to the tasks important for our improvement than to the people, place, events or things we come across. An example of priority list of the author is provided in page 69. Please refer the same before reading further. Readers are advised to prepare their own priority list as per their need. Please note that purpose of numerical values of priorities mentioned in the example priority list in page 69 is just to indicate the relative priorities of the various aspects of life. While training our mind we need to just contemplate about the relative importance of various aspects. In general, one should concentrate on the aspects mentioned in the green color (priority greater than one) and give them more priority than things that are mentioned in yellow color (priority between zero and one) and should avoid aspects mentioned in the red color (negative

priority). It will really help if one goes through this list every day once.

After contemplating on the priority list, we will intuitively assign right priority to the people, place, situation or a thing we come across. Once this is done, we will be able to do our work without straining our mind. This will keep the mind calm and more intelligent.

If one is frequently having a particular undesirable thought, he or she should mentally reduce the priority of the event and try to bring some other desirable event with higher priority (do some useful and interesting work) to focus.

When we are idle, we should give our mind some low priority work like being conscious of our body (bring attention to the body and feel it). It is like giving it an exercise rather than it doing its work based on the priorities we have mentally attributed to things in the

past. This we need to do to prevent unnecessary thinking, which disturbs the mind. So, the bottom line is that every now and then we should be conscious of our thinking and perceive the information in a better way. In other words, we need to be conscious whether our current thinking is in our area of interest as per our career growth or development of intelligence and if not mentally assign very low priority to it.

Example Priority List		
>1Trillion	Reference Priority.	Aggregate of our creator and total creation and its play.
10	Set More than one priority appropriately and engage in activities in these aspects accordingly.	Being conscious of our thinking, feeling and actions at this moment (Developing Intelligence)
10		Meditation and contemplation to reduce possessiveness, desire and fear.
10		Set the correct priority to your thoughts and feelings as they come up. (Developing Intelligence)
10		Improve our perception and knowledge of reality (Developing Intelligence)
10		Being conscious of Higher Power, who is planning everything. (Developing Intelligence)
9		Improving our knowledge and skill according to the profession.
8		Remember about next 5 pending tasks or tasks that should be done in next one hour
7		Relaxing your mind and feeling your body when you are free and also once every hour for 1 min. Just try to feel that "everything is nothing".
6		Remember and plan to execute regular work for the day
5		Contemplate and have right views about political events and other events of national and international relevance.
4		Contemplate and Plan for improvements in process and life situation at house and in work place.
3		Physical fitness and health issues (Exercise and Eat and drink rightly)
2		Money, Resource and Tasks planning for next one month
1		Philanthropy and rise to a cause for environment protection etc.
0 – 0.9	These are priority for the events happening around us.	For everything else happening around us (including objects, people, things and events including the results of our work) assign priority in between 0 and 0.9 in your mind while perceiving them and mentally compare it with reference priority of >1T of 'Aggregate of our creator and total creation and its play'. This helps in establishing the relative priority of an event compared to the total reality.
-1	Avoid activities in these categories	Too much entertainment
-2		Lack of Personal and other cleanliness and hygiene.
-3		Laziness and wasting time or procrastination or not completing work even if body and mind is healthy.
-4		Having negative attitude about everything
-5		Desiring for things, and fantasizing.
-6		Worrying about future
-7		Feeling sad about something which has already happened.
-8		Living in fear
-9		Living stressful life, overworking your body and mind.
-10		Addiction to substances, pleasure or events.
Compared to the reference priority everybody and everything is same and equal and nothing really matters at this moment. But still we need to work in the green spectrum (1-10 above) to improve our life condition.		

Chapter 9. Reflections on outside and inside worlds

How we perceive different aspects of life determines the quality of life to a large extent. The perceptions depend on the priorities we give to the various aspects of life. The type of perceptions of a person following spirituality is quite different from others. In this document the author describes about outside and inside worlds of both spiritual and non-spiritual person. Outside world is how we perceive external aspects of life (like job, family etc.) and internal world is how we perceive internal aspects (like peace, pleasure etc.)

For Non-Spiritual person:

Following are the suggestions for improvement in quality of perception of outside and inside world, for a non-spiritual person.

1) **Outside World:** A non-spiritual person is attracted and repulsed by various aspects of life. This attraction and repulsion make him take actions which often results in conflict of interest with others. This causes lots of stress and also affects his or her intelligence. Such people should realize that higher powers' influence in the matters outside of ourselves is 99 % and our own influence is only 1 % so he or her should be concerned more about the direction and magnitude of his or her efforts and not in the results. Instead of satisfying the desires and fears such people should look at how to satisfy the genuine needs.

2) **Inside World:** Our inside world for a non-spiritual person depends on the priorities he or she gives to the following aspects in life. It is often that too much importance when given to a particular aspect of life causes disharmony and unintelligence. For good

inside life we should give following priorities in the scale of 1 - 10 to these important aspects.

1. **Peace:**

Priority: 6 - 8

Reason: Reduces disorder in the system and provides spare brain capacity to work. Example - Meditation. Above 8 affects performance of other duties.

2. **Proficiency:**

Priority: 6 - 8

Reason: Provides happiness and employability. Example - Career Training and Physical fitness. Above 8 effects family life.

3. **Possessions:**

Priority: 3 - 5

Reason: Improves standard of Living. Example - Savings. Above 5 affects peace.

4. **Perfection:**

Priority: 3 - 5

Reason: Provides satisfaction and improves life. E.g. Process Improvement. Above 5 increases cost and often works against higher powers' direction.

5. **Power:**

Priority: 1 - 2

Reason: Affects peace and often works against higher powers' direction.

6. **Pleasure:**

Priority: 1 - 2

Reason: Addictive and drains our capacity to work.

For Spiritual Person:

Following are the perceptions of outside and inside world, of a spiritual person.

1) **Outside world:** A spiritual person says "to me everything is one and perfect and nothing matters. I realize that what we all experience are illusions. "

2) **Inside world:** A spiritual person says "I am not the Body, Mind and Intellect. I am just an identity. My BMC (body, mind complex) need to just manage these instruments using meditation and contemplation on spiritual principles.

Appendix 1. Metaphysics

Traditionally, the word metaphysics comes to us from Ancient Greece, where it was a combination of two words Meta, meaning over and beyond – and physics. Thus, the combination means over and beyond physics. In the definition found in most dictionaries, metaphysics is referred to as a branch of philosophy that deals with first cause and the nature of being.

One needs to have knowledge of high-level view of the system to assign the right priority for lower level aspects. For example, if one accepts the fact that there is a creator, who is guiding us, then he or she will assign comparatively less priority to results and more to improving his or her creativity and intelligence. The document is organized in question and answer format about metaphysical aspects. These are my conclusions purely based on logic.

Therefore, people with different religious background may find some of my conclusions contradicting with their beliefs. I request such readers to use their own intelligence and validate my conclusions and take it in good spirit.

1) Does god exist?

Our body, mind, intellect, and various creations including stars, planets etc. cannot happen on its own. Such intricate and extensive systems can happen only after systematic conception, design, planning and experimentation. Only an intelligent being can create such a system and we call it god.

2) How does god look?

Somebody cannot make an original design like himself or herself because it would then mean someone has designed the thing, which was already designed. Therefore, our original creator is not in

human form. Therefore, our original creator/s is/are formless or irregular form.

3) Who made god?

This is a very difficult question to answer, as god was not created in earth. We may sermise that the first being was always there somewhere in the universe, and one day he identified with himself and started developing other beings. The type of things needed to develop a being is not available in earth, so we may not know anything about the process.

4) Why did god create the world?

This according to me this is a very important question for which my answer is that god created this universe to experience his creativity. We experience our creativity by exploring the world that he has created, in all aspects (both external and internal to us).

5) Is life present only in earth?

Imagine you are so powerful and have created such intelligent beings like us and the intricate and vast universe. Will you just create the universe and leave it at that? If you have to further improve your creation, you have to experiment and thus study and manage your creations. God would have created a team to manage such vast and diverse creation. In addition, common sense says that there will usually not be only one-of-a-kind living being. There must be a team of gods working. If god is still experimenting and developing creations, He must definitely have different places for carrying out His developments elsewhere in distant places in the universe, outside our purview. Obviously then life did not start in earth.

6) Does god manage us?

This creation is planned for millions of years. Without guiding the flow of events, it is difficult for god to

achieve various milestones. Therefore, gods must be definitely managing us.

God must be managing us by mixing his thoughts with ours or by changing our nature or by some other means. However, everything is not god`s will because if that was the case, the scope for creativity will be less because everything will then be predictable.

7) What is the origin of life?

This is very difficult to predict, as life has not started in earth. The best guess would be that the ingredients for life were always there and one day trillions of years back, life was invented. When you read the answer to the next question, you will understand that this world is just some patterns made from the common source of energy. One day in the beginning one pattern started identified with itself and started developing other patterns. That original energy form is not available in earth, so it is

very difficult for humans to make matter or energy. From the complexity of life in earth and the various permutations and combinations that were available for our creators, it is obvious that life started in some different universe, some trillions of years back. The creators would have experimented and created various cosmic forms and life forms. It is obvious that they continue to experiment and earth is just a small experiment for the gods. If one has no prejudice and a clear mind, he or she will agree to this.

8) What is the nature of the creation?

If we look at some aspects of this world, like electricity, magnetism, gravity etc., it may be concluded that there is a common source of energy, which is making these things happen. The same is true about all life and matter. That energy or common source has to be everywhere. Scientists have found out that what we see as matter are

actually a combination of particles and waves. We call the particles as atoms, electrons, protons etc. These particles are the design elements and therefore cannot be the original source of energy. The atoms, electrons, protons etc. cannot move on its own. It is the underlying source of energy, which is causing all the movements. The original or common source of energy is that which presents itself as particles, waves and space between particles. There are some programmed patterns, developed by some intelligence, according to which, the source behaves. Therefore, we are all just wave patterns, which took shape based on some programmed patterns, but have wrongly identified as ourselves. Only if God (source of all energy) himself became eyes, ears, mouth etc., while developing them, thou could have tested their workings. This is the proof that the original source of energy can take any form. It has just decided to take the present form.

9) Who are we?

If everything is made from a common source of energy, everything is just that source of energy. Looking at the patterns, we got identified with the one nearest as ourselves. Everything is just happening, and we are simply not there or are just identities. It is very strong attachment due to the emotional dimensions.

10) Is there any re-birth?

God does not want us to know whether there is re-birth or not. I reckon that it may happen in some worlds and only partly in others, and the criteria for the same may be changing according to time. Things are more dynamic than it appears to be. God must be still experimenting and changing things. By re-birth, I mean to reckon whether some of the memories and configuration of the earlier birth are reused in a new birth. If the purpose of god is to just experience his

creativity than he would probably not do the complex thing of maintaining rebirth in all worlds. Moreover, god would be influenced by the need for different characters, rather than maintenance of re-birth. If you read the answer to the previous question, you will know that we never existed. In that sense how can there be rebirth?

11) What are dreams?

If we carefully observe the creativity in some of our dreams, we will conclude that these are sometimes created by god as movie clips and put in our mind. The clues for the movie clips are also taken from the events that are assigned higher priority by our mind (due to either desire or fear) and often have connection with our present-day thoughts. God must be studying some activity in our brain while we are dreaming and doing some maintenance work or

maybe it is a technical necessity that the mind remains active.

12) Why physical pain is there in this world? In my view god has experimented between no-pain and more-pain for benefits and drawbacks. Imagine what will happen if there were no pain. On slight un-happiness, one may cut oneself into pieces. In addition, pain is a way to tell the individual that something is wrong and he or she should meet a doctor. If pain were not the creation would not be serious in their business.

13) Why mental suffering is there in this world?

If god has to plan this creation for more than millions of years, there has to be many stories in it. There also need to be a direction in with the parameters life move. Without both positive and negative characters, there cannot be many stories. If god wanted, he could have made us all perfect. On slight

contemplation we will realize that the world would be a boring place to live if everyone was perfect. It is the diversity that makes life interesting. If sufferings were not there, the creation would not be serious with their roles.

14) What is the future of earth?

Initially when life started in earth, there were more physical pain, due to various types of diseases and accidents. Spirituality was developed in some parts of the world, when there was no industry. After spirituality peaked and declined, material developments started developing in some other parts of the world. Subsequently medicines were developed, which cured diseases and relieved physical pain. With material developments, comforts started increasing, but stress related suffering started increasing. Now importance of spirituality to relieve suffering again started taking momentum. All these

definately appear to be planned. If gods had not planned and managed us, there would have been much more disorder than what we are observing. Everything seems to be planned to start initially with more disorder and progressing towards order, in cyclical manner. For example in olden days most places many small kingdoms used to fight with one another. Later with the invention of weapons, there was more and more consolidation and larger empires were being built. Today there is democracy in most of the countries and there is a common currency for trade between countries. In addition, English is accepted as an official language by most of the countries. All these suggest that there is a progressive shift from less order to more and more order. The problems of deplition of ozone layer and global warming are also uniting the nations. From the way things are progressing, we may predict that

earth may one day become a single global village, without needing any visas.

15) How long will life continue in earth?

As far as the continuity of life on earth, we need to understand that, our creator, who has made this planet, is responsible for maintaining it. The knowledge of metaphysics helps us to realize the distinction between our roles and reponsibilities and those of our creators. Generally, we have duties to perform and the responsibilities lie with higher powers. Therefore, the highest reponsibilities rest with our creators. It is important that we do not worry about things that are not our responsibility. However, we need to apply our mind and try to do what we can.
