PREFACE

I got interested in spirituality from the year 2002 after some sudden change in my life condition, consequent to which I started reflecting on various aspects of spirituality like desire, fear, selfishness, acceptance, greed etc. This resulted in, me getting transformed from a pleasure seeker to peace seeker. During the end of year 2014, I came across and read some philosophical books and actively started meditation and contemplation. This resulted in me, getting transformed from a peace seeker to a researcher in philosophy. While contemplating I found that some principle aspects (of spirituality) are more important than others as the other aspects are derived from these main important principle aspects. At that time, I wrote a book titled Guide to Awakening (Published in May 2017), which is about principle aspects of spirituality. While writing

the book I realized that contemplation on the principle aspects vastly improved my intelligence besides the obvious benefit of peacefulness. This led me to write a book titled Intelligence Demystified (Published in September 2017), which is about human intelligence. While writing this book I realized that there is a purpose in all aspects of life and everything is interrelated. This led me to write the book titled Dynamics of Human Life (Published in April 2018), which is about relationship between various aspects of life, their purposes and purpose for human life. After writing the book Dynamics of Human Life I understood about wisdom, which led me to write the book titled How to gain wisdom? This book explains the terms Knowledge, Intelligence and Wisdom with methodology to gain intelligence and wisdom. After writing this book I realized that readers should be given preliminary knowledge of spirituality for getting

the grasp of knowledge of wisdom. Hence I am writing the book "The words of wisdom", which has most of the text from one of my previous books and repackaged for the benefit of the readers.

Mere reading of the book will not suffice. One must do contemplation on the ninety nine points of wisdom listed out in the book, on a regular basis, for getting sustained improvements in attaining realization for enlightenment.

Chapter 1. Introduction

Everybody wants success in life, but most of the people do not know what it means exactly and what needs to be done to be and remain always successful. Some feel to be a success means having lots of money and other resources, while some others feel success means lot of pleasures, while many others feel success means keep getting promotions and appreciations, while some others feel it is, having good family and other connections. The purpose in all these is to experience happiness. Just because they have not yet achieved their objectives, they keep trying to achieve those objectives, never giving second thought to whether these efforts are making them happy. They just feel once they achieve their objectives, they will be happy. But happiness is fleeting and in spite of achieving those objectives they remain unhappy. All these people in general

find happiness in doing some kind of activity or work to achieve either direct sense of achievement or get something out of it to get sense of achievement. There are also some who believe in spirituality and concentrate more on internal workings of the mind and spirit. So, in general, there are two broad groups of people. There, are one group people finding success from spirituality, while other group is finding success from doing work.

Both spirituality and work have some lacunae when considered separately. Spirituality does not provide resources, goods, comforts and security, which are important for collective wellbeing, whereas work does not enhance one`s mental capabilities or provide relief from stress, which comes with it due to conflict of interest with other individual or group. It is observed that those who believe in spirituality do not give sufficient importance to professional work and those who believe in

work do not give sufficient importance to internal aspects of the mind. Author feels that both approaches separately do not achieve the collective goal based on our long-term needs and our purpose in life. According to the author the purpose of human being or any creature on earth is to examine, explore, experiment and experience the self and the world. So, all aspects of life have some purpose from the point of view of our creator. We have to identify the purposes and accordingly have our goals. For example, according to the author the purpose of pleasures could be to provide challenges or hurdles. Imagine life without challenges. It would be so boring. Also, if we try to realize the purpose of bad experiences in life from the point of view of our creators or an independent observer, we will know that the purpose of different aspects of life is to make the life sustainable from the point of view of its continuity and interest. However, it is in our

interest to study the dynamics of good and bad experiences and influence good experiences.

First of all we need to understand why we are not always happy. Happiness and sadness are designed in such a way that they are temporary states. This is because of the need of flexibility to spawn interesting stories. We are designed as per the needs of our creators. If we realize why many of us enjoy sad and horror movies we will understand why there is unhappiness in this world. It is due to the story content. However it is in our personal interest to figure out how to reduce sadness and remain happy.

How much a particular aspect of life gives us happiness and the duration of happiness are dependent on the amount of importance we give to that aspect. Similarly how much unhappiness a particular negative aspect of life makes us and duration of sadness are dependent on the importance we give to that aspect. For example if for a person for having a

house is very important then for such a person buying it will make you very happy for a long duration and losing it will make you sad for a long duration. Happiness is often disturbed by unhappiness of equal or higher priority. For example if your son' s education is more important that the house you have recently purchased and the son fails in a subject you will be very unhappy. Similarly if your ego is very high and someone has insulted you then you may be sad even if you got a promotion on that day. In this document I refer to ego as possessiveness. Similarly if your expectations and fear are very high you are prone to more sadness due to disappointments and aversion.

Like for a smooth ride we need good shock absorbers and avoid potholes if the road has potholes, we need to tackle unhappiness at two levels. At the backend we need to reduce the priorities of those aspects that lead to unhappiness. This works as shock absorbers.

The same aspects which provide happiness will provide unhappiness when those aspects are absent. So we need to also reduce the importance of those aspects that give happiness to a reasonably low level. Desires and possessiveness often lead to disappointments. Also fear leads to unhappiness. So we need to reduce possessiveness, desire and fear. At the frontend we need to gain wisdom to avoid circumstances that lead to unhappiness. This is like avoiding potholes.

In our attempts to gain knowledge, intelligence and wisdom, the ultimate purpose for which we need those is of utmost importance. The next chapter describes our goal, vision, mission and methodology.

Chapter 2: Goal, Vision, Mission and Methodology

GOAL: Having maximum good experiences is the goal of human being.

VISION: To feel peaceful, complete and successful at all times.

MISSION: Acquiring wisdom and developing good life situation derived from actions leading to new perspectives, innovations or process improvements should be the mission of a successful human being.

METHODOLOGY: We often think of knowledge, intelligence and wisdom as they are synonymous. Although they are related there are slight differences between them. Let me define them in simple terms. Knowledge means knowing complex information specific to a subject. Intelligence means having a capacity in

general to understand complex matters. Wisdom means taking right course of action in complex scenarios. We need all the three for a successful life. Without intelligence we cannot acquire knowledge. Without knowledge we cannot gain wisdom. And without wisdom we cannot be successful. If one is not born with adequate intelligence he or she will need the knowledge needed to acquire intelligence. This may be in the form of steps to improve intelligence. For improving knowledge we need to listen, see or read information about the topic. For improving intelligence we need quiet mind which allows for concentration on a subject. For this we need to do meditation and contemplation on those aspects which makes our mind quiet. For improving wisdom we need to do contemplation on those aspects of life which results in realization of right priorities during perceptions. To understand this we need to know why and how we perceive with

improper priorities. We perceive with improper priorities because of attraction and repulsion during perception which arise out of identification with certain aspects of creation and the desire and fear of certain aspects of creation. For understanding those aspects we need to study the nature of ourselves including the nature of our mind and lives and metaphysics.

This book covers the knowledge needed to improve both intelligence and wisdom. The knowledge which helps to attain wisdom comprises the high level knowledge of science, philosophy and metaphysics. This book does not cover any aspect of Meditation (as the calmness achieved by meditation can also be achieved by contemplation on the aspects described in this book). This book also does not cover any scientific knowledge, except the high level understanding of the nature of our mind and lives. Chapter three helps us to understand

some important concepts of spirituality. Chapter four helps us to understand ourselves. Chapter five helps us to understand the nature of our mind and lives. Chapter six helps us to understand metaphysical aspects of our lives. Philosophical aspects of all these chapters are included in chapter seven as points of wisdom for regular contemplation. This chapter provides ninety nine points of wisdom. Contemplation on those ninety nine points help in attaining tremendous wisdom along with a steady and calm mind. Readers would have gained considerable wisdom, when they could relate their thought processes with the points of wisdom. For that to happen they should have contemplated on the points at least for a month. They will see steady progress after one month period.

Chapter 3. Philosophy – Possessiveness, Desire and Fear

We are born with various degrees of attachments, which the author defines as, the characteristic due to which, there is occurrence of enhanced intensity in perception or attribution of exaggerated importance towards self, family, other groups, objects and pleasure. These attachments cause possessiveness, desire and fear, which in turn give rise to undesirable thinking patterns, excited feelings and various emotions, which affect the intellect. Although possessiveness, desire and fear are the driving force of all actions, these also affect peacefulness and intelligence. In the absence of possessiveness, desire and fear the mind becomes very intelligent, peaceful and stress free.

The possessiveness, desire and fear apart from creating disturbance in the mind, also create various convictions, which give rise to likes and dislikes. The likes and dislikes make us perceive difference among people and do not allow us to realize the truth that everything and everybody are same and equal. The exaggerated perceived difference between people, other beings and objects do not allow us to realize our blissful nature and when things do not happen to our liking, we get irritated. Whatever our mind tells us, we accept it and blame others or the situation for our irritation. If we have to be joyful irrespective of the situation, we need to get rid of possessiveness, desire and fear.

How to reduce possessiveness, desire and fear?

We need to contemplate and suggest to our minds that possessiveness, desire and fear

affect our perception and thus affect our intelligence. When we do this our possessiveness, desire and fear will melt down.

Contemplation on the following points will help to reduce possessiveness.

- Possessiveness towards ourselves (which is ego) can be reduced and gradually removed by contemplating that god, who has created us and the universe is our real owner. We are how we are because the creators made us like that. So real credit or discredit of our intelligence should go to our creators to a large extent because one may get a confused mind which finds it difficult to improve. A grace of god is needed for such an individual to come out of his or her ignorance. Our job is to put efforts to improve our intelligence by using established facts and by exploring and experimenting. Our apparent false ownership is the cause of desires and fears, which affect our perceptions and thus peacefulness and intelligence.

- Possessiveness towards parents and children can be reduced and gradually removed by contemplating that we are just their care takers and the real owner is god, who created the sperm and ovary that created the children. Imagine you are a robot created by god and you are programmed to give birth to another robot, with same program but with different configuration (based on some random algorithm), when another robot presses on one of your buttons. Are not all robots, being with the same programming by god, belong to god and are equal? Why there should be so much attachment with specific people, to the extent that success or failure of those specific people becomes your success or failure? Why not identify with the whole mankind or with god and always feel happy for everybody`s success? Absence of possessiveness will make our mind perceive things better and thus help in achieving our goal, vision and mission.

- Possessiveness towards other groups and objects can be reduced by contemplating that only due to false perception, we feel some groups of people or organization or country or some objects are more important than others. We should meditate that the entire creation is one system and compared to the total creation and its play, the individual thoughts on group of persons or objects is of very little importance. Absence of possessiveness will make our mind perceive things better and thus help in achieving our goal, vision and mission.

Contemplation on the following points will help to reduce desire.

- Desire for happiness can be reduced or gradually removed by contemplating that both happiness and sadness are fleeting and therefore illusion. The desire for happiness creates an illusion that if we get such and such objects, we will be happy. If we do not get those things, we become unhappy and if we get those

things, we get temporary happiness along with desire for more things. We can achieve the feeling of bliss, irrespective of our material condition, if we do meditation and contemplation. This will help in perceiving things better and thus help in achieving our goal, vision and mission.

- Desire for an object can be reduced and gradually removed by contemplating what will happen if that object is there with us in plenty and everybody else also has it in plenty. For example, suppose we have a strong desire for a palace with large garden, swimming pool, etc. We should question ourselves that if we have all these things and also everybody else also have these then in that case, will we be always happy? We will compare with others, for other things and feel either happy or sad depending on the comparison. So, it is the perceived difference in the mind compared to others, which gives us temporary feeling of happiness.

The same feeling of happiness and greater bliss can be achieved by contemplating that all of god`s creation is equal and only their role and needs are different. If we reduce our desire, we will be perceiving things better and thus help in achieving our goal, vision and mission.

- Similarly desire for pleasure seeking like eating, drinking, sex etc. can be reduced or gradually removed by contemplating that they give temporary excitement and block us from realization our goal, vision and mission. These pleasures are addictive and too much of them are harmful for our body, mind and intellect.

Contemplation on the following points will help to reduce fear.

- Fear of death and ill-health can be reduced by accepting that what we fear can happen any time and we cannot do anything about it. But fear of them will affect our intellect and peacefulness and induce stress. Absence of fear will make our mind perceive things better and

thus help in achieving our goal, vision and mission.

- Fear of poverty can be reduced by contemplating that there are many who do not have even basic necessities and are still living. Even if we become poor, we will not be the only one. Ask yourself the question; "Why not me? Absence of fear will make our mind perceive better and thus help in achieving our goal, vision and mission.
- Fear of loss of prestige can be reduced by contemplating that in god`s eyes all are equal. We are just playing different roles as directed by god. Absence of fear will make our mind perceive things better and thus help in achieving our goal, vision and mission.
- We should recognize all the things we fear and eliminate them one by one by either dismissing as illusion, by faith that it will not happen, or acceptance of the possibility, in case by case basis. Only real problem is physical pain

which may come in various ways and you never know when it will come and we cannot do much about it other than managing them with medicines. But worrying about it will affect our present perception and thus will take us away from our goal, vision and mission.

Chapter 4: Spiritual Philosophy - Who am I?

The primary reason for lack of wisdom in us is that we do not exercise our will. In fact we do not know who we really are. We have done enough research in understanding our external world but have done too less to know about ourselves. We took how our system works for granted and did great planning to build external systems. Human body is designed as per the interest of our creators and a handle or steering is designed for our own interest. However most of us do not use the steering because we feel that the auto mode is sufficient to take us through. The steering in fact is what we are, and not the whole car. I have explained this later in this chapter.

When we were babies, there were no expectations from us. If our parents were not stressful we would be pampered with toys and we would be given most of the attention. So the first thing which we develop is the desire to have more attention and toys to play. In the case of stressful parents the babies would be fearful of negative consequences. When we grow up a little and start going to school we are told that life will be very good if we study hard and pass the exams with nice grades. Some are introduced to exciting things like going out for eating, playing, shopping, watching movies, listening to music etc. So, most of the time is spent thinking about objects of desires and fears of negative consequences. We just make up our mind that if we get these things we will be happy and we should avoid these things from happening. We decide what we want before knowing what we are and more importantly who we are. We are not to blame

for this because we are how we are made and in what circumstances we live in. Moreover until things are going good we don't even need to know who we are. But unfortunately the happiness from external things is short lived and we are into conflict of interest with others. These lead to lots of stress and worries. It is usually only when our circumstances change we realize new perspectives.

If someone ask us the question who are you? Some of us who are studying in school may say I am son or daughter of so and so. If we are elder and have a nice qualification or a designation we say I am so and so qualification or designation. Few may say I am husband of so and so. Regarding answer to what are you? We all say I am a boy or girl or lady or man depending on who I think I am. We answer these questions based on what we are mostly identified with. This identification affects our wisdom.

Following four points prove that what we see as matter is a common source of energy that is taking various shapes and forms out of free will according to some intelligence.

- The one who has designed a complex being like a human being must not be in the form of a human being because, if our original creator were in human form, then there will be ambiguity about creator of his own design. In other words how can someone do an original design of a thing which was already designed earlier? If we reason in similar lines it is easy to prove that our original creators were of basic form or formless in the beginning.
- Atoms, protons, electrons etc. cannot move on their own. They are just design elements. Therefore, there must be an underlying source of energy, which takes

up shapes and move about according some intelligence, which we perceive as science.

- The implementation of concepts of gravity, magnetism, electricity can only be explained only if there is an underlying source of energy that is taking various shapes and moving around out of free will and according to some intelligence, which we perceive as science. There is no other way it is possible to imagine these things to happen.
- Our creators must have themselves become the beings to test their functioning during their developments because without this they could not know about the internal workings of our mind and body especially our perceptions. This proves that the underlying source of energy can take any

form and our creators were formless in the beginning.

Let us first try to understand answer to 'what am I question' (or rather what is a human being) and then look at the 'who am I question' (or which part of human being is me).

What am I? Or what is a human being?

What distinguishes between living beings and other non living things are changes in form, five types of perceptions and the ability to move in our case. The changes in form and ability to move can only happen if the common sources of energy have free will. It is just that the nonliving part does not behave like living beings out of free will. As far as the perceptions like vision, feeling of pain, taste, smell, hearing etc. my closest guess is that these are just capacity of another type of energy (which we may call consciousness) to imagine these out of free will. If it is possible for one type of energy

to move around with free will, it may be possible for another type of energy to imagine with free will. If we concentrate on how one can hear sounds when there are just waves moving or how can one see when only light is received we may at least surmise that it could be that it is a kind of imagination. One more factor to consider about this is that while dreaming sometimes we feel the pain although there is no actual injury when we wake up. So our pain does not come from the injured part. It must be imagination. There has to be a capability of a particular type of energy to imagine such aspects like hearing sounds, vision, tasting, feeling etc. Our body and mind bundles all this things in a manner that it appears that it is the capability of our bodies. Obviously the part of energy that decides to imagine is not accessible to the human being. There is no other way we can guess these things to happen.

So my guess is that living beings are a combination of few types of energies. One type can change form at will and is outside of the minds (this is probably not exactly as we perceive). And another type can imagine sound, see, taste, smell and feelings at will and is inside a part of mind that imagines. There is a third type of energy that coordinates between these two which is a witness and guide for the other two types of energies. There are numerous copies of the world. One copy is the matter including our bodies which are made of one type of energy. There is one copy of the world imagined by our mind which is just a front view of the matter accompanied by imagination of sound, taste, smell, and feelings based on inputs in form of waves. These two types of energies although separate collaborate with each other to make an illusion of this world.

When a human being dies the collaboration between the energies stop and body becomes a

non living thing which changes form but not move about out of free will and consciousness continues to be conscious (perceiving the surroundings and imagining what it wishes, probably in a new world with a new body as if waking up as a baby), but outside of the mind of the previous body.

One may question that why should we believe in these theories when there is absence of solid proof. We need to understand that how we perceive this world has a strong effect on our perceptions and thus intelligence or wisdom. If we perceive the world as subtle we will be more relaxed and poised compared to when we perceive the world as gross. Our overall intelligence improves when we start getting closer to the reality.

One may also question that everything may be an imagination and there is only one type of energy. We have to realize that for such a world to happen there has to be a cause and an effect

or a perceiver and perceived or memory and an application. Therefore there has to be a system for matter (including light and energy) as a cause or perceived or memories and another set of energy similar to consciousness which receives all the inputs from the changes in matter (including light and energy) and imagines the world as an effect or a perceiver or an application. Our brain perceives the imagination as its own perception and starts thinking and feeling about them.

Who am I? Or what part of human being is me?

If we are made from a common source of energy, how can we be a qualification, designation or a relative of someone? Now further thinking will make us wonder how we can be some energy when we do not know anything about it. There are some types of energy which collaborate and make this world. How can I be a part of it? I know so little about

it. As per this reasoning we do not exist. However having perceived ourselves incorrectly (due to natural consequence of ignorance and assumption) as a human being our minds have created identities. It is like a part of a being appearing like a being and assuming like a separate being. An analogy would be like a steering wheel in a car assuming it is the whole car. For the user the whole car is one entity but the parts cannot assume it is the whole car. Similarly for others we are a human being but for our own self we need to identify which part am I. We need to realize that we start identifying with our bodies when we are babies and when we have not built our intelligence. With a faulty foundation we are so much engrossed in the world that we never get a chance to know who we are.

After realizing about error in identification we are just the identities having power to witness the human being, till we set right the minds of

the human being. This may take more than a life time due to the amount of memories we have created so long. Till the memories in the mind have the identities we are just the witnesses of the accompanying human being. We can slowly reduce the effect of error in identification by contemplating that we are not the human being. Even after realizing we are not the body, we should still work for getting better experiences as witnesses of the human being without taking anything personal.

One may argue what good is it when we are not part of what we are experiencing. The root cause of all our problems is ego. Ego results when our body and mind identifies with the subject. This identification causes selfishness and expectations, which in turn lead to conflict of interest with others. Moreover, most of the pleasure and suffering that we encounter is enabled by our ego. We also become unintelligent due to our ego. We need to really

assess the pros and cons of ego in our individual lives and make effort to annihilate it, if we find it as a net liability.

I could be my body, my mind, the human being, the source of energy, god, just an identity or nonexistent depending on what I decide. If we identify with our bodies we will get pleasure and pain. If we identify with our mind we will experience creativity and disappointments. If we identify with the human being (body and mind) we will experience a bit of all the above. If we identify with the god, just a witness, source of energy or nothingness we will get wisdom. Based on these identifications there are three types of people. First ones are those who want to achieve something to feel good (they use intellect of the mind predominantly to achieve something external to them). These are men of materialism. Such people make life quite interesting. The second type of people are those want to feel good by engaging in

pleasurable aspects of life (They use the pleasure centre part of the brain). These are men of indulgence. Such people are interesting characters when seen without attachments. The third group of people are those who want to feel good by knowing philosophical aspects of life (These people also use the intellect of the mind put purely to know and practice holistic knowledge of the mind itself). These are the men of wisdom. Such people try to see life as less dramatic and are more peaceful. A proper mix of these three types of people in varying degrees of characteristics is needed to make the world interesting.

Intelligence applied on resources is creation. In other words intelligence is the processing on the resources to make favorable differences in them. Even just imagining something is application of intelligence on resourceful mind and thus is a creation. Everything we perceive is a creation.

So Who am I? I am the will with intelligence. Let me explain this. I am that part of the human being that creates something and that which was not created by someone else. Our body, mind and intellect are created by god and so are not me. My intelligence is just created by my will, which no one else created. So my will or intelligence is me. Using the mind which was created by god I create my thoughts. So I am the intelligence and my thoughts are my creations. We are actually joint collaborators in modifying the resources which we have access to because there is already some intelligence in the resources used. Similarly god is also just will with intelligence. All resources are freely available to those who have access to. This world is joint collaboration of the intelligence of god with the intelligence already present in the resources used. Nothing can be made from nothing. So the original source of creation always existed.

Mind is the instrument which creates memories based on the priorities of perception. If the priorities are improper it makes distorted memories. Our intellect uses the distorted memories to create incorrect judgments. Our intelligence is to be conscious of all the distortions and aberrations and guide the instruments to the correcting paths. The learning of the instruments is a slow process. But we need to not identify with them. We need to have the discrimination between our intelligence and minds activity, which is a resource or someone else`s creation. Our intelligence should be realized to be a witness and guide of the mind's activities.

This realization of who I am will be very useful, especially for someone who is very stressed up and having depressing thoughts. However by just realizing who I am will not be enough for sustained improvement in our experiences. Our minds work on incremental basis and therefore

we need to contemplate on this aspect repeatedly for at least a month, many times a day to see improvements and there after we need to remind ourselves of this in less frequent intervals to sustain the improvements.

Chapter 5: Spiritual Philosophy – Metaphysics

Traditionally, the word metaphysics comes to us from Ancient Greece, where it was a combination of two words meta, meaning over and beyond – and physics. Thus, the combination means over and beyond physics. In the definition found in most dictionaries, metaphysics is referred to as a branch of philosophy that deals with first cause and the nature of being.

The document is organized in question and answer format about metaphysical aspects. These are my conclusions purely based on logic. Therefore, people with religious background may find some of my conclusions contradicting with their beliefs. I request such readers to use their own intelligence and validate my

conclusions and take it in good spirit. It has been observed that people with no desires and fears will get to know the reality better as their mind is free of any prejudice. If one wants to make use of the knowledge to make money, he or she will not get to know the absolute reality. However, when person who just wants to have the knowledge for its own sake, and contemplates over the issues, he or she will get to know the most correct estimate of the nature of the issue and the possible solutions.

1) Does god exist? Should we care about it?

An intricate, complex and orderly universe as ours must have been first designed by someone. Therefore, there must be intelligence with free will, which created this universe. We call such an entity as god. We should always be conscious of our creators. They are a part of reality. Our intelligence will be faulty without realizing their presence. If we realize that there is a god (or an intelligence), who is managing

us, it makes a marked difference in our lives. If we believe that a super-experienced god is managing us, we will be accepting this world, for what it is, rather than trying to change it. Nevertheless, we will explore it fully and try to get the best experiences out of it.

2) How does god look?

The one who has designed a complex being like a human being must not be in the form of a human being because, if our original creator were in human form, then there will be ambiguity about creator of his own design. In other words how can someone do an original design of a thing which was already designed earlier? If we reason in similar lines it is easy to prove that our original creators were of basic form or formless in the beginning.

3) Who made god?

This is a very difficult question to answer, as god was not created in earth. We may surmise that the first being was always there somewhere in

the universe, and one day he identified with himself and started developing other beings. The type of things needed to develop a being is not available in earth, so we may not know anything about the process. Nothing can be made from nothing. So the resources for creation always existed and never created. Intelligence applied on resources is creation. God is just the will with intelligence which used the resources intelligently and created the world.

4) Why did god create the world?

This according to me this is a very important question for which my answer is that god created this universe to experience his creativity.

5) Does life exist only in earth?

Imagine you are so powerful and have created such intelligent beings like human beings and the intricate and vast universe. Will you just create the universe and leave it at that? If you

have to further improve your creation, you have to experiment and thus study and manage your creations. God would have created a team to manage such vast and diverse creation. If god is still experimenting and developing creations, He must definitely have different places for carrying out His developments elsewhere in distant places in the universe, outside our purview as knowledge of process of development of life will affect our thinking. Therefore, then life did not start in earth.

6) Does god manage us?

This creation is planned for millions of years. Without guiding the flow of events, it is difficult for god to achieve various milestones. Therefore, gods must be definitely managing us.

God must be managing us by mixing his thoughts with ours or by changing our nature or by some other means. However, everything is not god`s will because if that was the case, the

scope for creativity will be less because everything will then be predictable.

7) What is the origin of life?

This is very difficult to predict, as life has not started in earth. The best guess would be that the ingredients for life were always there and one day trillions of years back, life was invented. When you read the answer to the next question, you will understand that this world is just some patterns made from the common sources of energies that have free will. One day in the beginning one pattern started identified with itself and started developing other patterns by free will. Those original energy forms are not available in earth, so it is very difficult for humans to make matter or energy. From the complexity of life in earth and the various permutations and combinations that were available for our creators, it is obvious that life started in some different universe, some trillions of years back. The creators would have

experimented and created various cosmic forms and life forms. It is obvious that they continue to experiment and earth is just a small experiment for the gods. If one has no prejudice and a clear mind, he or she will agree to this.

8) What is the nature of the creation?

Following four points prove that what we see as matter is a common source of energy that is taking various shapes and forms out of free will according to some intelligence.

1. The one who has designed a complex being like a human being must not be in the form of a human being because, if our original creator were in human form, then there will be ambiguity about creator of his own design. In other words how can someone do an original design of a thing which was already designed earlier? If we reason in similar lines it is easy to prove that our original creators were of basic form or formless in the beginning.

2. Atoms, protons, electrons etc. cannot move on their own. They are just design elements. Therefore, there must be an underlying source of energy, which takes up shapes and move about according some intelligence, which we perceive as science.
3. The implementation of concepts of gravity, magnetism, electricity can only be explained only if there is an underlying source of energy that is taking various shapes and moving around out of free will and according to some intelligence, which we perceive as science. There is no other way it is possible to imagine these things to happen.
4. Our creators must have themselves become the beings to test their functioning during their developments because without this they could not know about the internal workings of our mind and body especially our perceptions. This proves that the

underlying source of energy can take any form and our creators were formless in the beginning.

9) What are we?

What distinguishes between living beings and other non living things are changes in form, five types of perceptions and the ability to move in our case. The changes in form and ability to move can only happen if the common sources of energy have free will. It is just that the nonliving part does not behave like living beings out of free will. As far as the perceptions like vision, feeling of pain, taste, smell, hearing etc. my closest guess is that these are just capacity of another type of energy (which we may call consciousness) to imagine these out of free will. If it is possible for one type of energy to move around with free will, it may be possible for another type of energy to imagine with free will. If we concentrate on how one can hear sounds when there are just waves moving

or how can one see when only light is received we may at least surmise that it could be that it is a kind of imagination. One more factor to consider about this is that while dreaming sometimes we feel the pain although there is no actual injury when we wake up. So our pain does not come from the injured part. It must be imagination. There has to be a capability of a particular type of energy to imagine such aspects like hearing sounds, vision, tasting, feeling etc. Our body and mind bundles all this things in a manner that it appears that it is the capability of our bodies. Obviously the part of energy that decides to imagine is not accessible to the human being. There is no other way we can guess these things to happen.

So my guess is that living beings are a combination of few types of energies. One type can change form at will and is outside of the minds (this is probably not exactly as we perceive). And another type can imagine sound,

see, taste, smell and feelings at will and is inside a part of mind that imagines. There is a third type of energy that coordinates between these two which is a witness and guide for the other two types of energies. There are numerous copies of the world. One copy is the matter including our bodies which are made of one type of energy. There is one copy of the world imagined by our mind which is just a front view of the matter accompanied by imagination of sound, taste, smell, and feelings based on inputs in form of waves. These two types of energies although separate collaborate with each other to make an illusion of this world.

When a human being dies the collaboration between the energies stop and body becomes a non living thing which changes form but not move about out of free will and consciousness continues to be conscious (perceiving the surroundings and imagining what it wishes, probably in a new world with a new body as if

waking up as a baby), but outside of the mind of the previous body.

10) **Who am I**?

I am the will with intelligence. Let me explain this. I am that part of the human being that creates something and that which was not created by someone else. Our body, mind and intellect are created by god and so are not me. My intelligence is just created by my will, which no one else created. So my will or intelligence is me. Using the mind which was created by god I create my thoughts. So I am the intelligence and my thoughts are my creations. We are actually joint collaborators in modifying the resources which we have access to because there is already some intelligence in the resources used. Similarly god is also just will with intelligence. All resources are freely available to those who have access to. This world is joint collaboration of the intelligence of god with the intelligence already present in the

resources used. Nothing can be made from nothing. So the original source of creation always existed.

Mind is the instrument which creates memories based on the priorities of perception. If the priorities are improper it makes distorted memories. Our intellect uses the distorted memories to create incorrect judgments. Our intelligence is to be conscious of all the distortions and aberrations and guide the instruments to the correcting paths. The learning of the instruments is a slow process. But we need to not identify with them. We need to have the discrimination between our intelligence and minds activity, which is our resource and gods` creation. Our intelligence should be realized to be a witness and guide of the mind's activities.

11. Is there any re-birth?

Probably we never die; we just wake up in a new environment as a baby when there is

disassociation of the life from the present body. The two types of energies disassociate from each other. Our will must be with the life energy. The life energy along with the will must associate with different body (energy with form associated with life) and the previous body changes form and disintegrates.

12) What are dreams?

If you read the answer to ninth question you will realize that our life is just an imagination of some energy which appears real to us. In this sense dreams are also a type of imagination. It appears that the part that actually voluntarily imagines is not accessible (involuntary) to our bodies. Our dreams are solid proof that all our perceptions are just imaginations. They are just designed to appear little unreal so that we do not know the reality. If we know the reality we may not be serious in our roles, which may not be what our creators want. The whole creation

is designed to appear like a real world, at least initially.

13) Why are physical and suffering in this world?

Many of us wonder why there is so much pain and suffering in this world. We need to understand that without the pain, we will not be serious with our roles. If we do not have seriousness in life, it would become difficult for our creators to achieve the milestones as per schedule. Moreover, the technological creativity of our creators will be restrictive if only positive aspects of developmental possibilities are considered. There is some negativity in positivity and some positivity in negativity. From one perspective, what seems incorrect will seam correct from another perspective and vice versa.

In my view god has experimented between no-pain and more-pain for benefits and drawbacks. Imagine what will happen if there were no pain.

On slight un-happiness, one may cut oneself into pieces. In addition, pain is a way to tell the individual that something is wrong and he or she should meet a doctor. However as pointed before the nature of the physical pain is probably just imagination.

14) What is the future of earth?

Initially when life started in earth, there were more physical pain, due to various types of diseases, accidents and wild life. Spirituality was developed in some parts of the world, when there was no industry. After spirituality peaked and declined, material developments started happening in some other parts of the world. Subsequently medicines were developed, which cured diseases and relieved physical pain. With material developments, comforts started increasing, but stress related suffering started increasing. Now importance of spirituality to relieve suffering again started taking momentum. All these definitely appear to be

planned. If gods had not planned and managed us, there would have been much more disorder than what we are observing. Everything seems to be planned to start initially with a logical progression, in cyclical manner. For example in olden days most places many small kingdoms used to fight with one another. Later with the invention of weapons, there was more and more consolidation and larger empires were being built. Today there is democracy in most of the countries and there is a common currency for trade between countries. Also, English is accepted as an official language by most of the countries. All these suggest that there is a progressive shift from less order to more and more order. However the challenges faced by humans keep increasing. It is difficult to predict the future of our creator' s imaginations.

15) How long will life continue in earth?

As far as the continuity of life on earth, we need to understand that, our creator, who has made this planet, is responsible for maintaining it. The knowledge of metaphysics helps us to realize the distinction between our roles and responsibilities and those of our creators. Generally, we have duties to perform and the responsibilities to maintain lie with the higher powers.

Similar to our life cycle for system development, our creators must have a process. In the development cycle for our civilization, we may move one day from implementation phase to maintenance phase and possibly there may be a cycle change. However it is difficult to predict the future of our creator' s imaginations accurately.

Chapter 6: Nature of Human mind and Life.

In this heading we will study the human mind, the decision making process of the human mind and the nature of human life.

HUMAN MIND

At a high level, the primary constituents of mind are sense and memory perception instruments, memories, intellect, and firmware (intelligence) and our will. All the constituents are similar in all humans, and only the configurations are different. The interplay of firmware with memories and intellect result in intelligence (You have seen in previous chapter that this is the intelligence of the mind as opposed to our intelligence, which is the intelligence of the will) of the mind. In this chapter we will refer to intelligence as intelligence of the mind only).

Decisions based on intelligence result in actions. This document describes the workings at high-level of human memory, consciousness, intelligence and the will.

Human Memory:

Everything in the mind is just impressions, which we call memory. When our senses perceive an event, memories are formed. Each memory has a priority assigned to it. Memories with higher priorities are thought about frequently and can be remembered after longer period. We forget the weaker memories very fast. Every moment of time, the mind accesses either an old memory or an event from our senses and creates fresh memory out of it. Intelligence is nothing but activating the right memory and extrapolating it to make decisions. All actions are nothing but making decisions to use the controls of the body based on the intelligence. Some of our configurations, which are also pre-built memory or impressions,

determine how we perceive certain events. These configurations determine the level of attraction or repulsion with which one perceives things. Stronger memories lead to disturbances in the mind and thus it affects mindfulness. The incorrect priorities also lead to incorrect decisions and thus it affects intelligence. The bottom line is that our consciousness and intelligence depend on the type of memories we carry.

Consciousness:

We have seen in previous chapter that consciousness is like an imagination of an energy called life energy, just like our dreams. Based on inputs from various processes in the body (which receives inputs from the environment as waves) the life energy creates imagination of sounds, vision, pain, taste, smell, feelings etc. in the real time. For example when we get hurt, because there is a wound and a pain we assume that the pain is because of the

wound. In case of a wound our body just sends the inputs to the brain and based on the inputs our consciousness imagines the pain.

Intelligence:

Intelligence here refers to the firmware of the mind which coordinates with intellect, memories and consciousness and leads to thinking and feeling activities of the mind.

Developing intelligence is the most important aspect of humanity. At a high-level Intelligence (Intelligence of the mind) is capacity to find solution to a logically challenging problem, often involving people with conflicting interests and complex aspects of life. At lower level it is deciding what next bit of information to be processed is and what way it is processed. It depends on perception of events or entities from memory or external source. It is driven by priorities of events and entities in the mind. When the priorities are very high there is more thinking and feeling activity leading to

disturbance and incorrect decisions and actions. When you are doing an activity and if some other event or entity has been given a high priority it interferes with the activity and processing of that activity is inappropriate. It is like for example, if you are studying and mind is disturbed, you are not actually studying because the process of studying is incomplete due to interference by a different process. Our mind selects particular records from the memory and senses in time sharing bases, according to the priorities, extrapolates them (based on related memories), feeds the thinking process, creates fresh memories, initiates actions and brings them to consciousness in parallel processes. For the same situation the intensity of perception is different for different people leading to different decisions for the same situation. Thus, it can be reckoned that, intelligence is different among different people, although algorithm of intelligence is same, as

the memories (including configurations) on which the intelligence work is different, due to difference in ways of perception and level of mindfulness of an individual. The way our intelligence is implemented is that for high priority situation, since faster response time is needed, the intellect decides immediately, without referring to the memories already stored. For low priority situation the intellect refers to the memories already stored (our memory bank). Accuracy of an operation depends on the scale at which input and output parameters are measured. Similarly, human intelligence is fine grade or coarse grade. Fine grade is when priorities of various aspects are relatively low in magnitude. Therefore, in this case, the events are perceived with relatively lower priorities and hence our intellect considers and checks with our memory bank for relative memories and compares various options and gives accurate results. Coarse

grade is when priorities of various aspects are very high. In this case the events (from memory or senses) are perceived with higher priorities and our intellect decides on that immediately, without referring to the memory bank, hence the decision will not be accurate. In short, we may say fine grade intelligence is more accurate, orderly, and slow whereas coarse grade intelligence is more interesting, disorderly, and fast for the reasons explained.

Lack of intelligence happens due to lack consideration of some facts and having incorrect priorities of some aspects of life. To develop intelligence, we need to create memories of important facts about plants, animals, the universe, and ourselves by study and research. We also need to have a high-level overview of principle aspects, which help us to prioritize the important aspects of the universe. This we do by meditation and contemplation on the principle aspects to know closest estimation

of the nature of those aspects and their relative importance. The by-product of being intelligent is getting better experience in this world. The by-product of acting intelligently is increased efficiency, flexibility, and freedom.

Every moment of our lives, we make decisions regarding the events presented to us from our memory or some external event. Even to not do anything is a decision. The decisions depend on the priorities we mentally assign to the various aspects. These happen so quickly that most of the time we feel we are impulsively reacting to the situation. However, everything is happening based on some major principles. If we understand the principles, which created the problems in our mind, we can find a way to correct those conditions. Therefore, to say our entire life depends on these principles is not an exaggeration. Many people have right configuration of intelligence by birth and are successful without being aware of the

knowledge of principles that affect intelligence, but for majority of people knowledge and application of these principles is necessary.

Our intelligence is affected due to two types of forces acting on our mind viz. attraction and repulsion. These forces create disturbances and incorrect priorities while perceiving various aspects life. The disturbances affect one type of intelligence, which we may call Low Level intelligence, which is capacity to do a complex logical analysis. The incorrect priorities affect another type of intelligence, which we may call High Level Intelligence or wisdom, which is capacity to do logical decision involving complex aspects of life and often with conflicting interests.

The forces of Attraction and Repulsion are manifested as follows.

1) Attraction: Manifested mostly as Desire for Creativity, Desire for Possession, Desire for Pleasure and Desire for Appreciation.

2) Repulsion: Manifested mostly as Fear of Poverty, Fear of Discomfort or Pain, Fear of betterment of others, and Fear of Depreciation.

Improving Higher Level Intelligence:

To improve higher level intelligence we need to contemplate on those aspects of life which help us to perceive everything with correct priorities. When we do contemplate on those aspects, we gain wisdom, along with the added benefit of improvement in lower level intelligence due to our mind becoming calm. I would like to call those aspects as points of wisdom. There are ninety nine of them in the last chapter.

Improving Lower Level Intelligence:

An optimum interest in the subject matter and a calm mind are needed to develop lower level intelligence. Therefore, the factors helping High Level Intelligence also help in improving lower level intelligence.

However, lower level intelligence also increases with practice in area of interest.

Will: We have understood in the previous chapter that we are just the will, assuming the entire human being as ourselves. Our will is just like a handle to witness both mind and consciousness. It can also guide the mind. While the mind and consciousness are doing their activities our awareness is decided by our will. It could be on the consciousness (present events from senses) or the mind (past memories). It generally keeps shifting because we have not learnt how to handle our will. For most people the will is a zombie, never exercising its role.

SUMMARY

1. People differ with respect to intelligence due to the memories they have and create.

2. Types of memories depend on priorities with which we perceive things.

3. The configurations of perception instruments in the mind are different for different people. However, the algorithm for intelligence is similar.

4. Memories with incorrect priorities lead to incorrect intelligence along with a disturbed mind.

5. To improve perceptions we need to first have a control over our mind, and then feed the mind with correct relative priorities of important aspects, by trying to realize the closest estimate of the nature of these aspects.

6. Meditation and contemplation on spiritual principles help in having a control over the mind by changing the configurations of the perception instruments in the mind.

7. Spiritual principles help to realize the closest estimate of relative priorities of various aspects of life.

8. Stronger memories lead to faster response but do not consider alternative perspectives. Such memories often create stronger reactions than needed and thus lead to disorder.

9. Weaker memories lead to considerations of all related perspectives and thus are accurate. However, weaker memories lead to slower response time.

10. Consciousness or life energy imagines vision, sound, taste, smell, feelings etc. based on inputs from the senses at real time where as the mind extracts past memories and extrapolates them as the thinking activity, creating fresh memories.

11. Our will is a handle to witness the activities of the consciousness and mind. It can also

guide the mind. Controlling our mind is like exercising our will.

DECISION MAKING PROCESS

The most important finding in my study of spirituality is that our mind makes decisions like a computer processor, based on the priorities of related aspects in the mind. Due to fast reaction, we feel that our decision-making is instantaneous and random. However, some study of our mind would reveal that all our decision-making is based on the priorities with which we perceived various events previously. Our perceptions depend on the configurations of our mind. Although for most people the configurations do not change much during the lifetime, systematic contemplation on spiritual aspects do change the configurations considerably. Our perceptions depend on the intensity with which we perceived a similar aspect in the past. In this way, our intelligence is changing every moment. We are making it

either better or worse. Perception with high intensity leads to unintelligence and stress although in some cases like love it gives temporary pressure. Thus, highly attractive and repulsive perceptions are the causes of lack of intelligence and stress. When we perceive with high intensity the mind becomes more dominant, and it becomes difficult to control. Thus, the first step in getting control of our mind is to start perceiving with lesser intensity. Regular meditation and contemplation help us achieve this.

Our mind constructs a stack of important events based on the connection with the current event, sorted in decreasing order of priority of the events. It picks up the events from the top of the stack and starts extrapolating them as the process of thinking. If there are high priority events in the stack, the mind will keep thinking about them. This keeps the mind disturbed and person with such a

mind will find it difficult to concentrate on lesser priority events like studying or listening. One example of this is if a person has a very strong desire to succeed, he or she may end up over thinking about that aspect to the extent that the mind is never free to study. We have looked at one problem in having incorrect priorities (confusion due to busyness). Another problem in incorrect priorities is that they lead to incorrect decisions due to oblivion of important related perspectives around the issue. We can understand how our mind works based on the priorities and improve our perceptions by altering the priorities during perceptions. Our mind creates a virtual database in the mind with relative priorities of important aspects based on the priorities with which we perceived those aspects in the past. In the case of decision involving two choices, the relative priorities of aspects, which relates to for and against the choices are added together and

the decision is arrived at. However, the problem is that due to strong attachments we have for some aspects, one of the options has very high priority and many other aspects having low priorities are ignored. Therefore, we need to update the virtual database in the mind by contemplating the correct relative priorities of the important aspects of life. However, the correction is a slow process as it works on incremental basis. If one has perceived an aspect with high priority for a thousand times, then one needs to contemplate on correct relative priority of that aspect with other aspects around a thousand times.

One of the important aspects, which set the priorities, are whether the person perceives things that are external to him with higher priority than the things that are internal to him or the vice versa. This is related to his or her level of ego. If the ego level is high, such a person will always perceive everything based on

how the matter will satisfy his or her expectations. The ego gives rise to desires and fears, which in turn give rise to different types of expectations. Such a person will perceive the matters that give good experiences to his self with higher priority. On the contrary, a person with low level of ego will be able to perceive with clarity what is happening around him and his or her mind will be clear to make decisions involving external matters, without prejudice of how it will affect him or her. Even people prone to lethargy and addictions, generally have high level of ego. The ego takes birth when we start identifying with our body. If there is a strong identification with our body, the ego level will be very high. If identification is more with the mind, the ego level is relatively low. If identification is with neither the body nor mind, the ego level will be very low. Such a person gives less importance to himself or herself and more to the total system or the world. If a man

with high level of ego looks for external things for his or her satisfaction, his or her life will be a total disaster. Such a person needs to one day realize that he or she needs to look inside for the remedy. However, if a person of low level of ego looks for external things to express his creativity, he or she will succeed very well. Such a person when also looks inside his mind and explores his or her mind. Such a person will be an inspiration of all.

Once the ego and its related desires, fears and expectations are taken care of, then it would be very easy to work out the relative priorities of other aspects.

It may be reckoned that the ego, desires, fears and expectations are there for a purpose. Imagine what will happen it we all were all perfect. Such a world would be very less interesting. It is the diversity and sustained progress, which makes the life in this world interesting. Same is the case with other qualities

like beauty, strength, speed etc. There will be interesting stories only if a few of us have those excellent qualities. Therefore, one should not look down upon others for their inferior qualities or behavior, but be grateful for what one has.

One may wonder why we should look for improvements in intelligence, if it is going to make life less interesting in future. It is simply just for progress. We need to explore whatever we are presented with for improving our lives. This is progress, which usually have a negative side also. The ultimate responsibility of diversity and sustained interest lies with our creators, and that of progress lie with us.

Following examples explain how the relative priorities work. These cases are not exhaustive and are far from being perfect. They only serve the purpose of leading to a further study.

1. Suppose a child has priority set in the mind for pleasure equivalent to a priority of 8 out of

10, he has desire to study equivalent to a priority of 3 out of 10, and fear of scolding from parent equivalent to priority of 9 out of 10. For the fear of parents, the child will pretend to study in front of the parents, but his mind will be on the objects of pleasure.

2. Suppose a penniless person has hunger equivalent to a priority of 8 out of 10, but righteousness equivalent to priority of 9 out of 10, he or she will not steal even if nobody is watching and food is in front of him or her.

3. Suppose a person who has respect for fellow citizens' equivalent to priority of 9 out of 10 finds a person who has erred in the traffic, which caused frustration equivalent to 8 out of 10, he or she will not honk. Even a priority of 9 out of 10 for patience, or a priority of 9 out of 10 for non-judgment, or a priority of 9 out of 10 for peace can do the same effect in our decision-making. If suppose the person perceives with a priority of 10 out of 10 that in

some other city the traffic rules are followed very well because of better system, he or she may want to come up with suggestions for improvement.

4. If a person has a priority equivalent to 10 out of 10 for entire mankind, 9 out of 10 for his country, 8 out of 10 for his state, 7 out of 10 for his city, 6 out of 10 for his locality, 5 out of 10 for his family and 3 out of 10 for his own self then he or she is less likely to be do wrong things.

5. If a person has a higher priority for righteousness than profit making, he or she will not do unethical practices and will not overstress himself or herself.

6. It is just because one of the aspects related to an issue has very high priority it appears that, the mind is coming up with only that one solution. For example if a boy has a mental priority of perception (POP) of fifty for good looks. However, he has a negative POP or

aversion of nine each for non-vegetarian and smokers. If such a boy meets a good-looking girl, who eats non-vegetarian food and is a smoker he will be immediately attracted to the girl as he has a great attraction for good looks, which will make him ignore the other aspects that he dislikes. However if the person reduces his maximum intensity of perception to below 10, then he will perceive the other qualities also and may feel less attractive about the girl. When the intensity or POP is very high it results in two aspects that affect our intelligence. First aspect is that other perspectives are ignored (which may become an issue later) and the second aspect is that the mind becomes much occupied with the attractive thing and our mindfulness is lost.

7. When the relative priorities of perceptions of different aspects related to an issue are in a narrow range then the decision-making is more mindful. In such a case our mind comes with the

summation of priorities of related aspects for and against an issue and comes up with the decision-making.

From the above examples, we may conclude that if we come up with a list of relative importance of various aspects and input them in the mind by regular contemplation, our overall intelligence will improve by a very large extent. However, for keeping our mind free of disturbances, it is needed that the priorities of events are generally kept low. It has been observed that to reduce our overall intensity of perceptions, just knowing what our relative priorities should be is not enough. We need to regularly contemplate on some aspects of life which correct our perceptions. There are ninety nine such points of wisdom listed in chapter seven.

Please find below an example list of how we may come up with relative priorities. This is not exhaustive. It just serves the purpose of giving

an example. Just by reading this once or twice will not help. Our mind works on incremental basis. Hence we need to regularly give our positive inputs to the mind to keep improving in our level of intelligence and wisdom.

Example of Relative Priorities List		
10	Engage in these activities, aspects and behavior as per the priorities.	Wisdom, Intelligence, Humanity, self worth, righteousness
9		Meditation, Peace, Philosophy, patience, kindness
8		Country, patriotism etc
8		Physical fitness, health and hygiene
7		Resources / Business / Career planning
7		Creativity (Creating solutions, motivation, interest and fun)
6		Improving our knowledge and skill according to the profession.
5		Social Initiatives and Activities
4		Education and Family
3		Entertainment
2		Philanthropy and rise to a cause for environment protection etc.
1		Everything happening around us
-1	Avoid activities, aspects and behavior in these	Lethargy, Overworking , pleasure seeking
-1		Addiction to substances
-1		Being fearful, overly ambitious and impulsive
-1		Lack of self respect and respect for others

NATURE OF LIFE

At a very basic level, we want to have good thoughts and feelings at most of time and

depressive thoughts and feelings at least of time. Based on the above objectives, we need to put our efforts. For this, we need to know the priorities of important aspects of life. This document will help us realize the nature and relative importance of various aspects of life. To know more about these aspects, the important things that we need to learn and understand are, the nature of world in earth, the high level nature of human life, the relative priorities of various aspects of life and the nature of problems faced by man.

The nature of the world in earth

If we look at some aspects of this world, like electricity, magnetism, gravity etc, it may be reckoned that there is a common source of energy, which is making these things happen. The same is true about all life and matter. That energy or common source has to be everywhere. Scientists have found out that what

we see as matter are actually a combination of particles and waves. We call the particles as atoms, electrons, protons etc. These particles are the design elements and therefore cannot be the original source of energy. The atoms, electrons, protons etc. cannot move on their own. It is the underlying source of energy, which is causing all the movements. The original or common source of energy is that which presents itself as particles, waves and space between particles. There are some programmed patterns, developed by some intelligence, according to which, the source behaves. Therefore, we are all just wave patterns, which took shape based on some programmed patterns, but have wrongly identified as ourselves. Only if God (source of all energy) himself became eyes, ears, mouth etc., while developing them, he could have tested their workings. This is the proof that the original source of energy can take any form. It has just

decided to take the present form. Whether we perceive this world as gross or subtle makes a difference in our perceptions. Gross aspects are perceived with higher priorities compared to subtle aspects.

High-level nature of human life

We need to understand the nature of life to make it work for maximum benefits. Due to diversity of experiences, we all may perceive life differently. However, it is more of an art than anything else. The attributes of an art are story content, diversity and interest, where as those of science are research, efficiency and intelligence.

This creation is not optimized for Intelligence and efficiency, but is optimized for having stories, diversity and interest. Therefore, life is an art of God to enable art, science, sport, recreation and torment for us. The break-up of various components according to me is as follows.

1. Art (50% - Interesting, Stories, Diversity):

For our creators this world is 100% an art because they just use their tools or resources and create a diversified world just for realizing their creativity. Considering life predominately as an art gives more importance to our creativity. We should experience and appreciate the art of god and try to understand higher perspectives. Therefore I would like to consider our life as around 50% art.

2. Science (20% - Research, Intelligence, Efficiency):

We need to have a scientific temper and explore the world. Although for our creators this world is an art piece we have lots to learn about matter and energy. However exploration of matter and energy stops after college for most of us. Therefore I would like to consider our life as 20% science.

3. Sport (15 % - Competition, Rules):

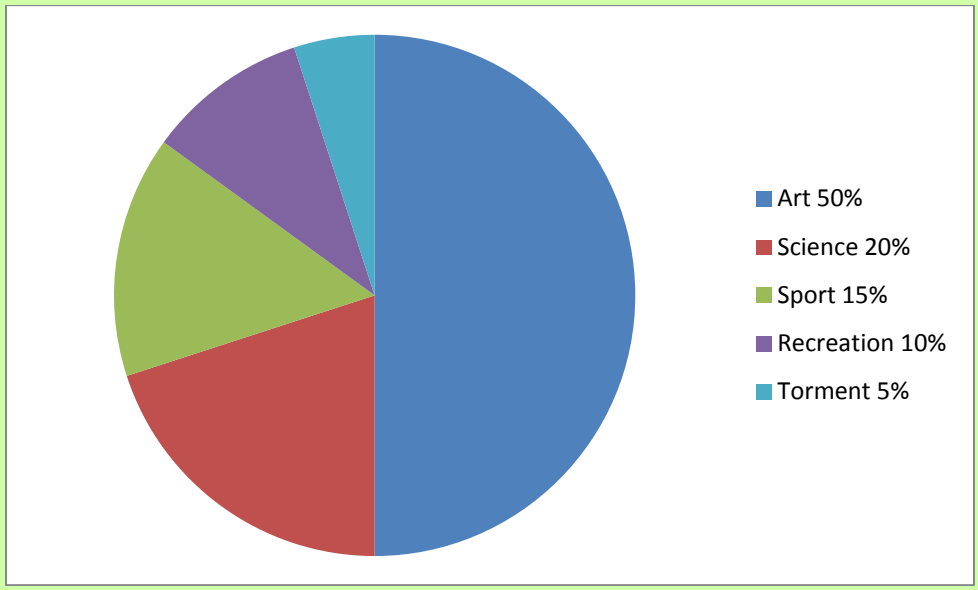

In life there are rules to follow and competition to face, like a sport. But apart from winning our attitude also counts. Moreover if we consider life predominately as sport there will be too much stress on us. Considering this I would consider life as 15% sport.

4. Recreation (10% - Sensitivity, Pleasure):

Although we have desire to enjoy life to the fullest, we usually do not get time for recreation due to our career. Moreover if we get involved in recreational activities frequently they will become boring. For those reasons, I would like to consider life as 10% recreation.

5. Torment (5% - Disease, Exhausting):

We all suffer torment in one form or other during some periods in life. This could be illness or feeling of depression. We would like to get out of this zone as early as possible and would not like to think too much about the negative aspects. Therefore I would like to consider life as 5% torment.

High-level nature of human life i

As shown in the above figure, life is more of an art than it is anything else. Therefore, we should not just try to maximize our efforts and just try to get maximum out of it. We should make time for fun and enjoy the creative aspect of it.

Consequences of treating life as an art (a role in a drama of life) are as follows.

1. Even negative roles have some purposes.
2. Participation is more important than achievements.
3. Different people like different roles. This helps in maintaining diversity.
4. Stress is less as you consider life as just a role in the drama of life.

5. You strive to improve your performance and thereby try to get better roles.

6. In a drama team performance is more important than individual brilliance.

7. The rich considers it as just a role and not gets attitudinal problems.

8. The poor considers it just a role and will not get overly dejected.

9. We make interesting stories wherever possible.

10. We will consider death as just end of a role and will not take it as something drastic.

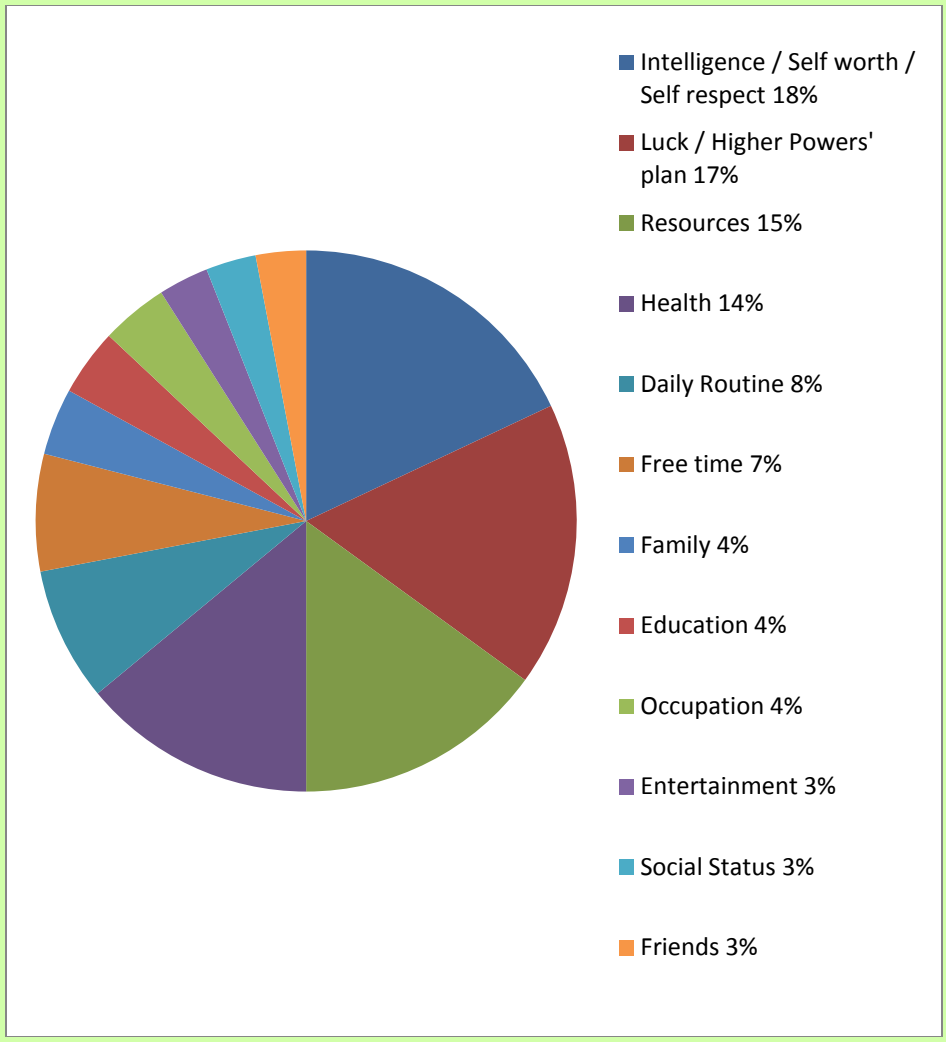

11. Everything is as per role, so no tension.

12. Since diversity is promoted, efficiency maybe only one of the considerations. Creativity and fun aspects get highlighted.

13. We will worry about the result only after the end of the role and not during our performances, but enjoy all types of performances.

Relative priorities of important aspects of human life:

There are various aspects in our life with varying degree of importance. It helps in our decision making if we know the relative priorities of important aspects. In my view the following graph shows the relative importance of important aspects in our life. The other aspects derive from these.

Relative priorities of important aspects ii

As shown in the above figure, there are so many aspects in life. However, we neglect some important aspects and run after only selected few. For example, many go for acquiring resources and entertainment. If we do not sharpen our blade and just look at productivity, we will not achieve the best. Our mind is the greatest tool we have and we need to put efforts to improve them. Contemplation and meditations are the means to improve one's mind.

Nature of problems faced by man

The problem of physical pain is the only real problem faced by a person. The problem of physical pain is disguised as three types of problems. These are lack of following three important aspects of life.

1. Mental health: A person with good mental health is in joyous state at all times. Although most people do not have control over the mind, we ourselves are mostly responsible for maintaining good mental health. Good intelligence (emotional) helps in keeping good mental health. For most people mental health depends on external situations, which they try to control. A Few have practiced spiritual ways to decouple mental health from external situations. Mental problems are disguised as various emotions, which lead to depression in extreme cases. Most mental problems, unless it has progressed into a disease, can be solved by philosophical methods. Mental health can be 100 % in our control, until we become very old. Even the suffering of physical pain can be reduced to a considerable extent if mental health is made sound by using philosophical methods.

2. Physical health: This is in our control to the extent of maximum of 15% only, because it depends on various factors, which are beyond our control. However, if we are totally careless and do not take basic precautions, then it may become a worrying problem. Physical problems are disguised as diseases. Lack of physical health can lead to poverty (resources problem) and mental problems.

3. Resources (wealth): Depends on our mental and physical health, circumstances and intelligence. Therefore, this also depends on various factors and this is in our control to the extent of maximum 15% only. Resource problems are disguised as poverty. Poverty can lead to physical health problems and mental problems.

While we have more control over our mental health, most people spend more time in acquiring resources. We are more responsible for having a good mental health and our higher

powers are more responsible in maintaining our physical health and resources. Nevertheless, we need to try our best to impress our higher powers by doing required activities, while not defocusing from our mental health.

Summary:

1. We are just identities with roles in the drama of life. The higher powers decide most of the scripts in the play. We manage our faculties with the best of our abilities to play our part.
2. Life of man in earth is more of an art than it is anything else. Art represents expressiveness, diversity, interesting stories etc.
3. We need to work out proper priorities of various aspects of life based on reality and not based on attraction and repulsion. This also helps in improving intelligence, which helps in getting better roles and reducing discomforts.
4. Our roles are constrained by the plans of the higher powers. Not all will get the best roles,

but we all can do our best by completing it in a unique way and make the life interesting.

5. Suffering of physical pain is only the real problem being faced by man; it is disguised as problems in physical and mental health and lack of resources.

6. All suffering can be reduced by means of philosophical methods.

7. There is lot of potential in improving the decision making of the mind.

Chapter 7: Words of Wisdom

Wisdom comes from knowledge of those aspects of life which help us to perceive with the correct relative importance of all relevant aspects. We may call such aspects as points of wisdom. If we regularly contemplate on the ninety nine points listed below, we will gain tremendous wisdom. Our minds progressively change on repetition. Therefore, we need to rely more on repetitive contemplation rather than on one time intensive realization. Due to the same reason some of the points have been included as a separate point even though they appear to be similar to some other point.

1. If we closely analyze life, we will realize that, it is made up of numerous opposing forces or aspects, with the resultant force tending towards zero. It is only due to our mind's consideration of the individual effects, without

reckoning the balancing effects, that we have feeling of likes and dislikes.

2. Our higher powers manage us on the basis of rules made on the foundation of equality, diversity, challenges, learning, interesting stories and logical progression. Which rules apply on us depend to some extent on the luck. The higher intelligence or god must have its own way of maintaining equality. If we contemplate enough on the various ways equality can be maintained, we will realize this fact. Therefore we should accept our situations as appropriate, instead of reckoning our situations as inappropriate.

3. Every problem is like a constraint in the game of life. These constraints make the game interesting. It is only because our attention is on our expectations, and not in the pleasure of tackling the constraints, that we do not like them. Even if all our expectations come true,

our situation will not change, until we learn to perceive everything correctly.

4. If anybody harms us or something bad happens to us, we need to consider three perspectives about it before reacting. First one is that our higher powers allowed that to happen. Second one is that our higher powers might have planned that to happen. And the third aspect is that negative aspects are constraints and circumstances to test us to enable us to learn and grow. Considering these aspects, we need to respond to such situations with less than ten percent intensity than what our mind suggests. Similarly, for the same reason, all past events should be perceived with very less importance.

5. The root cause of all our problems is ego. Ego results when our body and mind identifies with the subject. This identification causes selfishness and expectations, which in turn lead

to conflict of interest with others. Moreover, most of the pleasure and suffering that we encounter is enabled by our ego. We also become unintelligent due to our ego. We need to really assess the pros and cons of ego in our individual lives and make effort to annihilate it, if we find it as a net liability.

6. To live with freedom we have to reduce fear as much as possible. Fear is such an emotion, which can corrode the entire fabric of our personality. All the negative emotions and actions are enabled by fear. Fear can be removed by practicing acceptance and faith. We can also get rid of fear by realizing that we are not the body. It is the common source of energy which is manifesting as all the beings and things in the world. Changing our way of perception is the best way to deal with fear.

7. All the pleasures of this world are like poisoned chalice. They are addictive and make

us unintelligent. Sustainable happiness is that which is based on sound reasoning and not the one which gives us pleasure and good feelings.

8. To take correct decisions we need to realize the relative priorities of important aspects in life. Most important aspects are intelligence, health and resources in that order. Education, career and family come after the above three. Therefore we should strive to improve intelligence and take care of our health as a priority. Our higher powers have a great influence in our lives. Therefore having adequate intelligence is needed to be in proper equations with them. We should not unnecessarily worry of other aspects if we have adequate measures of intelligence, health and resources.

9. Attraction and repulsion in the mind makes it unintelligent. Desires and fears exaggerate certain aspects of the objects during perception and make us to think about them with higher

intensity. This leads to incorrect perceptions and confused mind. Such a mind does not reckon all relevant perspectives during perception and thus becomes unintelligent.

10. Stress levels are much lower if we realize that, higher powers' responsibilities towards us are always there in all our endeavors. It is an art to leverage on the higher powers' support in all our endeavors, without blaming anybody and not expecting any particular results. When we have expectations or blame others, we start to lose some other relevant perspectives.

11. We need to discriminate between feeling and thinking. Feelings are changes in the mind for pleasure and pain, that is based on perception, where as thinking is a rational process that is based on logical reasoning. When thinking is associated with feeling, it tends to become illogical. Hence, our thinking should be disassociated from our feelings. A major difference between intelligent and

unintelligent person is that in intelligent person, thinking is less dependent on feelings and in unintelligent person, thinking is more dependent on feelings. Another difference between the two is that intelligent people give more importance to thinking than feeling and in the case of unintelligent people it is the other way around.

12. When we try to perceive others, including our higher powers as intelligent, we will perceive a better world. To do this we need to put ourselves in others shoes and understand them.

13. Like how we study the account statements to know the health of a company, we also need to find out about our mental health regularly. In our daily routine, free time to evaluate our mind for level of peacefulness is very important. This is specially so for those who have a hectic schedule. The best way to know about the pulse

of our mental health is to ask ourselves the question; what do I want?

14. Two important things to learn in this world are to come up with right priorities and expectations about important aspects of life. The best ways to control one' s mind are to realistically widen one' s range of expectations and to realistically narrow down one' s range of priorities during perception to a low level.

15. To achieve anything big two things are needed besides the resources. They are an intelligent mind and a motivated mind. Intelligence is an art of better perception, which is achieved by meditation and motivation is the art of maintaining proper drive to do the work by regularly perceiving the need to finish the pending work for the value it will provide in the medium and long term. The value of the work need not be materialistic only. To have good experiences we should have higher motivation

like the purpose in life, rather than the motivation due to fear of consequences.

16. We often miss the fact that a perfect world will be less interesting than an imperfect one. We all need interesting stories that are not possible if we all think and act perfectly. This is the reason we are all made differently. However, it is in our own interest that we choose a path of peace, wherever possible. However, we need to also ensure that we do not despise others who are different from us. The aspect of diversity makes the life interesting.

17. It is often good to admit to ourselves that we know very little rather than assuming or guessing. Knowledge of lack of knowledge is important knowledge. When we perceive lack of knowledge, we are more likely reason out different perspectives around the issue. It is good to be not too sure about anything and have an open mind.

18. If we believe there is a solution to the problem we are facing, then we are more likely to find the solution, if it exists. If we repeat to ourselves that there is a solution to all our problems and that there is a better solution for each known solution then the rate of progress in improvements in efficiency, process and quality will keep increasing until maturity is reached. However, for that to happen we need to keep ourselves stress free.

19. All our achievements are subjective because they depend on circumstances and the help we receive from others. Moreover, the importance of any such accomplishment is very low compared to numerous accomplishments, which are possible. It is just because many could not or have not achieved the endeavors, we feel our achievements are great.

20. All our knowledge is subjective because it is very difficult to arrive at the right priorities of the information, which have many competing

perspectives, and whose relevance keeps changing with times.

21. Faith is the confidence one gets from reasoning that everything is as per proper order according to the plan of the almighty. For this, one has to have an estimate of the amount of experience and knowledge of the almighty. A man of faith does not want to change anything. Such a man, if he renounces ego, will just do the work for his sustenance and will mainly explore and experience the life for what it is. Nevertheless, he needs to be clever in his dealings with others.

22. We often look for internal accomplishments from external pursuits and external accomplishments from internal pursuits. However, external pursuits lead to external accomplishments, if successful and internal pursuits lead to internal accomplishments, if successful. Nevertheless, internal accomplishments often help in our external

pursuits, by enabling the concentration of mind. Therefore, it is very important to look inwards, within our mind for our overall well-being.

23. We need to keep in mind that we cannot gain anything in this world in the long run. We live for limited period and we let go of everything one day. All that matters is how you experience this life.

24. We should remember and apply Gandhi' s saying that we should live as if we were to die tomorrow and learn as if we will live forever.

25. An intricate, complex and orderly universe as ours must have been first designed by someone. Therefore, there must be intelligence with free will, which created this universe. We call such an entity as god. We should always be conscious of our creators. They are a part of reality. Our intelligence will be faulty without realizing their presence. Whether we realize that there is a god who is managing us or not,

makes a marked difference in our lives. If we believe that a super-experienced god is managing us, we will be accepting this world, for what it is, rather than trying to change it. Nevertheless, we will explore it fully and try to get the best experiences out of it.

26. The one who has designed a complex being like a human being must not be in the form of a human being because, if our original creator were in human form, then there will be ambiguity about creator of his own design. If we reason in similar lines it is easy to prove that our original creators were of basic form or formless in the beginning.

27. Atoms, protons, electrons etc. cannot move on their own. They are just design elements. Therefore, there must be an underlying source of energy, which takes up shapes and move about according some intelligence, which we perceive as science.

28. The implementation of concepts of gravity, magnetism, electricity can only be explained only if there is an underlying source of energy that is taking various shapes and moving around according to some intelligence, which we perceive as science.

29. Our creators must have themselves become the beings to test their functioning during their developments. Otherwise, they could not know about the internal workings of aspects like pain, feelings etc. This proves that the underlying source of energy can take any form and our creators were formless in the beginning.

30. Whether we perceive this world as gross or subtle makes a marked difference in our behavior. If we perceive it as subtle, we will be more relaxed and poised, compared to when we perceive it as gross.

31. Whether we consider the creation of god, an art, science, sport or adventure, make a

difference in our perceptions about life. As this life is more about interesting stories and diversity than efficiency, intelligence or speed, it is more of an art than other fields. Therefore, we need to take things lightly, in the same way we treat an art piece.

32. Our life may be a horror, romance, tragedy, thriller or an art story. Nevertheless, it is specially designed and developed for us to experience it. Some people go inside the character and enjoy or suffer the scenes. Others witness everything by maintaining distances from the characters and enjoy the plots. Nevertheless, it is prudent to play our character without too much personal involvement, although it may appear realistic to the other characters. If we consider life as a movie, we will not have expectations at all times, but instead will just watch and relish the proceedings as they come moment by moment. However, we have to play our part, as we understand it, by

planning and charting our part of the script. Our roles are always less important compared to the plots, although our expectations make us think otherwise.

33. There is a purpose for everything in this world. Negative aspects like smoking, drinking etc. are there to learn from mistakes, to bring in some seriousness in life and to bring in diversity for its story content. Therefore, we should not despise anything or anybody even if it looks negative. Everything is proper at the proportion at which they are happening and at the period in evolution at which it is happening. We look at everything from our point of view. Therefore, we feel some things are not proper.

34. Mind always goes on extrapolating and exploring ideas in all directions and we need to keep guiding it at the back end by having strong value system and at the front end by validating with the value system. We need to realize that our thinking process is a separate

involuntary process based on the priorities during perception and we have a responsibility to stream line the process. For doing this we should not identify with the thinking as our own and have sorted out the relative importance of important aspects of life.

35. At a particular moment, we will speak or do the thing that is destined to happen based on our past inputs. We can only work for future destines. Therefore, we should accept the present and the past and live fully in the now. By learning to perceive better by contemplation on important principles, we will be better equipped in the future.

36. We always give undue importance to what others think of us. This is a burden because it takes away lots of freedom from us. It is advisable to develop and depend on our self-worth, rather than on endorsements from others.

37. Many of us wonder why there is so much pain and suffering in this world. We need to understand that without the pain, we will not be serious with our roles. If we do not have seriousness in life, it would become difficult for our creators to achieve the milestones as per schedule. Moreover, the technological creativity of our creators will be restrictive if only positive aspects of developmental possibilities are considered. There is some negativity in positivity and some positivity in negativity. Nothing is completely wrong or completely correct. From one perspective, what seems incorrect will seam correct from another perspective and vice versa.

38. We can respond to tough situations coolly by practicing mental simulations. However, regular practice is needed to bring about a lasting change. Hazards can happen to anybody at any time. Therefore, we should prepare ourselves mentally for all hazards that could

happen. One way to do this is, to regularly imagine the situations, that we have lost all the things and people we are dependent on. It also helps if we imagine and accept all the hazards, which may happen. Acceptance does not mean that we will not do what is needed to deal with it. It is just that we do not panic. When our mind is habituated with a situation, it will not panic.

39. We can always decide to feel good irrespective of the situations. We can always find a reason to smile if we search for one. At the end of the day all that matters is the number of feel good moments out of total awake moments. Similarly everything is beautiful, if one decides so. We feel something is not good only because we have interpreted a similar thing as 'not good' in the past due to some external or internal prompting. We can change that by new inputs.

40. We give undue importance to beauty. This aspect of us is a burden because it raises our

expectations and makes us perceive others lowly. Therefore, we should not judge the letter by looking at the cover. Instead, we should look at the other things, which the person brings on the table. How we perceive a person is up to us, if we have our mind in control.

41. Most of us feel that becoming rich will solve all our problems, and we make efforts to build a successful career to achieve it. However, the kind of experiences we have depends more on our intelligence than wealth. Wealth may help us in getting good experiences providing we have adequate intelligence. Therefore, we should primarily strive to improve on our intelligence by doing some study and research on it. This aspect is very important in our lives.

42. Having comforts in life does not guarantee sustained happiness. In spite of having all the comforts any negative news or a skirmish with family member or colleague can make us unhappy. We need to realize that the

importance of all external accomplishments and possessions reduces with time. Therefore, we should depend on the satisfaction based on our internal reasoning. Our career and possessions only take care of our requirements to live. To experience the life in its fullest, without any pressures is living. We need to take care of our requirements without affecting the experiences of living the life at its fullest.

43. If our creators wanted, they could have made us all very intelligent. However, the need for a world to be interesting and to be one where there is lot to learn made them to decide to make it diverse instead.

44. We should not be too sure about anything. There are many possibilities that are hidden. Our creators are very powerful and can do all type of miracles. It is just that they want us to be behaving normally that they make it appear that everything is as per the laws of science.

45. No work is menial if we reckon all perspectives around it. It is our incorrect perception about the work, which makes us unsatisfied. We always prefer the career, which is full of creativity, excitement, challenges and prestige. However, the apparently menial work allows the mind to be free to explore it creatively to learn to face challenges in life and live a life with contentment.

46. There is a purpose for everything in this world. Each one of us is unique and relevant for different periods, like roles in a play. All are equal in importance, if all perspectives are considered. The difference between people is circumstantial and exaggerated by our desires and fears. It is very difficult to determine the importance of one's role in life. Each one of us is created for a purpose. Only our creators know the relative importance of the individual creation. They may not be only interested in the

ones who are very qualified. Only our perceptions limit us.

47. When we think slowly, we will reckon more perspectives, than when we think fast. We need to slacken down our thinking rate. This can be achieved by perceiving everything with less intensity. The slower our response in a conflict situation, the better the response will be.

48. True and permanent love is one, which is for the sake of the loved one and is not dependent on any of the qualities or behavior of the loved one. It is just an expression of exclusive care for a chosen fellow being. However, we must realize that love and hate are like sugar and salt. A small amount of them is very relishing. More of them are like poisoned chalice.

49. Our spouse and children do not owe us respect. They are autonomous. They are just a member of a team with shared resources and autonomous agenda. Consideration for our

loved one' s feelings should be an important aspect even when we know more than they do. Our family members are a means to understand the world. They are at best, when they are representative of the world, and not when they are exceptional. We should not expect A+ from them.

50. We are used to giving importance to our family members and ourselves more than to other people. This may sometimes lead to disharmony. While we may use our resources primarily for our family members and ourselves, but for all other aspects, we must give more importance to righteousness than to support for family and ourselves. For being righteous, we need to consider welfare of entire humankind or world before family members and ourselves for matters other than our individual resources.

51. Attachment to our family members makes us always anxious about their well being. We

need to realize that all possibilities exist and therefore, if our experiences depend on well being of our family members, there will be frequent turmoil in our mind. We need to realize that everything happens as per higher power's plan and therefore we need to be detached from other members of the family.

52. In most of the situations of conflict in our daily life, we need to consider ignoring them. We do not need to respond to each of them. Silence is gold.

53. Most important quality of a person is the quality of his or her thinking. We should regularly strive for self-improvement in the quality of our thinking. If we perceive everything with low intensity and practice mindfulness, our quality of thinking will drastically improve.

54. Gaining control over our mind is the most important aspect in one's life. Even if we may be

ruling the whole world, if we do not have control over the mind, we may lose everything any moment. If we perceive everything with low intensity we can gain control over our mind.

55. If we perceive about ourselves correctly then we will perceive about the world correctly. Therefore, if we have to know the world, we should know ourselves first. We are just the will with intelligence.

56. Our world is, as we perceive. If we want to change our world, we need to change the way we perceive. Freedom to perceive the way we want is a great tool if we know how to use it beneficially. For example we may perceive that our daily work is a tremendous opportunity and service to mankind. This will keep us motivated.

57. Our higher powers plan our life based on our nature, which is assessed from our thinking. Therefore, we need to consciously assess our thinking, and make efforts to correct our nature

accordingly, to change our life for the better. We need to realize that our thinking process is a separate involuntary process based on the priority of perception and we have a responsibility to stream line the process.

58. We become slave to our addictions. We should be aware of the pitfalls in life and avoid them. If we find ourselves addicted to anything, we should address the problem on priority. The struggle is only during the initial days. Once we come out of it we should keep contemplating about its harmful effects, to ensure we do not go back to it.

59. We should develop some beneficial mindsets that are very important in life. Few of them are inquisitiveness, understanding, non complacency and respect for all.

60. We make decisions based on the priorities we have automatically set during our perceptions. So sorting out the relative

priorities of competing aspects helps in improving our overall intelligence. Some of the issues we need to sort out are the realization of relative importance of some competing aspects like interesting and efficiency, positioning and progressing, diversity and simplicity, mind and body, security and peace, collective and personal, dependability and responsibility, righteousness and profitability, present and future, righteousness and sustainability, righteousness and faith, observation and participation, journey and destination, etc.

61. We are always yearning for appreciations. We do not realize that the feeling of being appreciated affects our intelligence. We need to rely more on self worthiness rather than on appreciations.

62. Most of us accept what our mind comes up with, without trying to question them. Mind exaggerates everything based on the priorities with which we perceived the matter previously.

We need to realize that our thinking process is a separate involuntary process based on the priority of perception and we have a responsibility to check its validation.

63. Not practicing philosophy is like using our mind as per factory settings. If the settings are suitable for the environment of the user, it works very well. Otherwise, they are the cause of disastrous user experiences. We need to exercise our will to guide our minds with philosophical principles to improve it.

64. Like how our projects have different phases and milestones, our present civilization must have phases and milestones. This is an obvious necessity for a project of the size of our civilization. Without proper plans, developments would have been haphazard. Our creators must be guiding us in achieving the milestones because it were not the case the timelines would be very difficult to achieve and

lots of development would then remain pending.

65. Like how we address defects in a system by recording them and resolving them, we need to do the same for our own mind. We should not take it for granted that our mind is a foolproof system. It is because we do not look at our own drawbacks that we always find fault in others.

66. Why we think god made this universe makes marked changes to the way we perceive this world. In my opinion god made us to express his creativity. Similarly, we should express our creativity by exploring ourselves and the world.

67. The relative importance of any particular problem we are facing is proportional to the importance of the sector it belongs to and inversely proportional to the total number of sectors. So if there are ten sectors like education, family, resources, career, stress, physical health, job satisfaction, recognition,

status and entertainment and if all the sectors are equally important than no problem is more than ten percent grave. We get overwhelmed by our problems because we give undue importance to it.

68. Unknown is good. New things can be experienced only in the unknown. We assume that the new territory which we may be put into will be risky, but no interesting things can be experienced if we are not put in unknown zone.

69. One should perceive everything as 'good' or 'don’ t know now' instead of judging anything as bad because our super experienced god has allowed that to happen and there is a purpose for everything in life. After first accepting the apparently not so good situation, we should come up with a suitable response.

70. One of the most unfortunate things is to look down upon oneself. One may realize shortcomings in some of one's behavior or

capability, but one need to also realize that what has happened may be as per some bigger plan and there is always scope for improvement. Everyone is just fit for his or her role in life.

71. Extreme Physical pain is the only suffering we actually have. All other sufferings and worries are due to our incorrect perceptions. Our egos create fear, exaggerate even the slight discomforts as great sufferings and make us worry about them.

72. A man of wisdom is one who can see things and beings as they are without exaggeration or lessening their value. Discrimination of ego from the being is needed to achieve it. Ego enables desire and fear, which exaggerate the things and beings during perception.

73. We should not take ourselves too seriously. Each one of us is of very little importance, although our egoist mind makes us appear very

important. We should perceive ourselves as less important because by doing so our worries will be perceived as less important. We can thus manage our lesser important worries without panicking.

74. There is lot of difference between knowing everything is all right and feeling it. Knowing takes into considerations all aspects and perspectives before reckoning it and feeling is just a temporary snapshot of how it will be when everything is all right. We may feel that everything is all right even when we are oblivious of some facts. Our quality of life is permanently elevated to a very high level when we realize or know that everything is all right.

75. While we should relish good food while eating, we should not give too much importance to eating, at other times, as overeating is harmful and our expectations for tasty food may lead to disappointments. Food should be considered just as a source of energy.

76. We should neither look down upon sex as degrading nor consider that as only means of enjoyment. It is a gift from god. However, we should restrain ourselves from thinking about sex for more than fifteen minutes a day. Over thinking about sex, make us unintelligent.

77. It is just that we ask for unreasonable favors, that god does not respond to our prayers. If we have the intelligence to understand god and reason out with him, he may respond to our prayers. Praying and meditating are important aspects of living.

78. To learn from our mistakes in behavior we need to ascertain the exact reason for doing the mistakes. Our mind makes fast decisions based on the priority of perception of various aspects of life. We need to take some time to understand the decision process. Understanding the decision making process is the first step in achieving wisdom.

79. Our individual life span is less than two percent of that of our civilization and there must be many such civilizations. Therefore, our importance is one by trillion. Similarly, importance of other things is one by trillion.

80. We get feeling of boredom and loneliness only due to our expectations. If we let go if our expectations, we can be at ease in all situations.

81. Everything in this world has side effects. It is prudent to have a low footprint so that the environment is sustained.

82. In order to avoid getting lost in the hectic world we should keep making efforts to keep it simple. Small steps at a time will make it more manageable.

83. We should be more satisfied with our possessions and less satisfied with our intelligence. Real progress is progressing in our intellectual capabilities.

84. More sufferings happen in this world due to our expectations than due to anything else. We want everything good to happen to us, where as life is usually a mixed bag of both positive and negative experiences.

85. As we grow old, we usually encounter the fear of death and suffering due to that. We have to realize that everyone who is born will die. There is nothing personal about our life. We should reckon that this too shall pass.

86. In our day-to-day work, the importance of planning cannot be overemphasized. Planning the day's work reduces stress and disappointments tremendously.

87. Desire and fear are those aspects in our personality, which rob us from basic freedom. In a mind filled with desires and fears, ego rules. It is impossible to control such a mind. We need to realize that desire and fear are illusionary and should consciously reduce the importance of

the objects and situations that we desire or fear while perceiving.

88. Anger and hatred harm ourselves more than those against whom we have those feelings. These are like salt. A slight amount will help us taking action and more of it will make it unpalatable. If we imagine situations which make us usually angry and develop some measure of acceptance of those situations, our anger starts reducing.

89. One who feels envious of anyone is very unlucky. We need to realize that each one of us is unique and serve different purposes. We all have many things about which we should be grateful.

90. We should strive to achieve the kind of perception, which makes us reckon ourselves neither inferior nor superior to anyone. We should daily contemplate that all are equal.

91. Many times, we get negative or depressing feelings and thoughts. Sometimes we may even do not know the reason for those thoughts. Nevertheless, we should be prepared for such thoughts by being aware that such thoughts come to everyone and that we should give them a pass. It will also help, in such situations, if we do not take ourselves too seriously.

92. Changes do happen in life regularly. Therefore, rigid thoughts are a liability. The most flexible person gets going the smoothest. We should not be too sure about anything. All possibilities exist.

93. There are three types of wealth in life. First one is financial wealth. Health is also wealth. The wealth of health is more important than the financial wealth. The third and most important wealth is the psychological wealth. The opportunity for psychological wealth creation is tremendous but is usually not explored to its full potential. Therefore we should not give too

much importance to financial wealth creation alone.

94. When we do favors to others, we should not expect anything in return. Expecting returns for a favor may often lead to disappointments.

95. If one thinks high about his or her achievements or possessions, then the further progress will be affected as in such a case the mind will become busy with unnecessary processing, which will affect our intelligence by not reckoning different perspectives.

96. It could be possible that a single god made the plan of all religions. Therefore, we should respect other religions, the same way we respect our own.

97. We should give more importance to our daily work than to future or past works. If we have utilized our day correctly then we should treat it as success. Results are secondary.

98. The best way to stop worrying is to downplay the issue and to realize different perspectives around it. For doing this we need to realize that our thinking process is a separate involuntary process based on the priority of perception and we should not identify it as our own.

99. Some level of politics is always there in all fields due to competition. We need to embrace it, however ensure that it does not become the most important or only thing in our life. It is an art to promote ourselves, without compromising on our value.

CONCLUSION

We are just the will with intelligence. Intelligence applied on resources is creation. Our bodies are creations of god and our resources. Our minds make decisions based on priorities of various aspects of life. Our will accepts or rejects the decisions. We need to realize the discrimination between our intelligence and that of our minds. We need to guide our minds to realize the important aspects of life and their priorities. However the existing improper priorities of various aspects in the mind make it confused and present challenges against improving it. So the first step to improve is to understand the nature of mind. The next step would be to contemplate on those aspects that that improve in identifying the important aspects with correct priorities.

Mind is a fantastic instrument which makes accurate decisions based on the priorities of various aspects set in it. If priorities are incorrect it will provide incorrect decisions. If priority of an aspect is very high it will lead to agitated mind while perceiving it. If one has to become intelligent he or she has to set the priorities right. Meditation and contemplation are the means to do that. This is a slow process by design as imperfect decisions often make interesting scenarios.
